Preface to the second edition *page* xiii
Preface to the first edition xvi
Introduction xx

1 Interactions of particles and radiation with matter **1**
1.1 Interactions of charged particles 2
1.1.1 Energy loss by ionisation and excitation 3
1.1.2 Channelling 12
1.1.3 Ionisation yield 13
1.1.4 Multiple scattering 18
1.1.5 Bremsstrahlung 19
1.1.6 Direct electron-pair production 22
1.1.7 Energy loss by photonuclear interactions 24
1.1.8 Total energy loss 24
1.1.9 Energy–range relations for charged particles 26
1.1.10 Synchrotron-radiation losses 28
1.2 Interactions of photons 31
1.2.1 Photoelectric effect 32
1.2.2 Compton effect 33
1.2.3 Pair production 36
1.2.4 Total photon absorption cross section 38
1.3 Strong interactions of hadrons 41
1.4 Drift and diffusion in gases 43
1.5 Problems 49
References 51

2 Characteristic properties of detectors **56**
2.1 Resolutions and basic statistics 56
2.2 Characteristic times 62

Published online by Cambridge University Press

2.3 Dead-time corrections 63
2.4 Random coincidences 63
2.5 Efficiencies 65
2.6 Problems 69
References 69

3 Units of radiation measurements and radiation sources 71
3.1 Units of radiation measurement 71
3.2 Radiation sources 76
3.3 Problems 79
References 81

4 Accelerators 82
4.1 Problems 87
References 88

5 Main physical phenomena used for particle detection and basic counter types 90
5.1 Ionisation counters 90
5.1.1 Ionisation counters without amplification 90
5.1.2 Proportional counters 97
5.1.3 Geiger counters 104
5.1.4 Streamer tubes 106
5.2 Ionisation detectors with liquids 110
5.3 Solid-state ionisation counters 112
5.4 Scintillation counters 122
5.5 Photomultipliers and photodiodes 130
5.6 Cherenkov counters 142
5.7 Transition-radiation detectors (TRD) 146
5.8 Problems 150
References 151

6 Historical track detectors 160
6.1 Cloud chambers 160
6.2 Bubble chambers 163
6.3 Streamer chambers 167
6.4 Neon-flash-tube chamber 169
6.5 Spark chambers 170
6.6 Nuclear emulsions 173
6.7 Silver-halide crystals 175
6.8 X-ray films 176
6.9 Thermoluminescence detectors 177

Published online by Cambridge University Press

6.10 Radiophotoluminescence detectors 178
6.11 Plastic detectors 179
6.12 Problems 180
References 181

7 Track detectors 186
7.1 Multiwire proportional chambers 186
7.2 Planar drift chambers 191
7.3 Cylindrical wire chambers 197
7.3.1 Cylindrical proportional and drift chambers 198
7.3.2 Jet drift chambers 205
7.3.3 Time-projection chambers (TPCs) 208
7.4 Micropattern gaseous detectors 212
7.5 Semiconductor track detectors 215
7.6 Scintillating fibre trackers 219
7.7 Problems 222
References 223

8 Calorimetry 230
8.1 Electromagnetic calorimeters 231
8.1.1 Electron–photon cascades 231
8.1.2 Homogeneous calorimeters 238
8.1.3 Sampling calorimeters 244
8.2 Hadron calorimeters 249
8.3 Calibration and monitoring of calorimeters 258
8.4 Cryogenic calorimeters 261
8.5 Problems 267
References 267

9 Particle identification 273
9.1 Charged-particle identification 274
9.1.1 Time-of-flight counters 274
9.1.2 Identification by ionisation losses 278
9.1.3 Identification using Cherenkov radiation 281
9.1.4 Transition-radiation detectors 289
9.2 Particle identification with calorimeters 292
9.3 Neutron detection 296
9.4 Problems 301
References 302

10 Neutrino detectors 307
10.1 Neutrino sources 307
10.2 Neutrino reactions 309

Published online by Cambridge University Press

10.3 Some historical remarks on neutrino detection 310
10.4 Neutrino detectors 311
10.5 Problems 323
References 324

11 Momentum measurement and muon detection 327
11.1 Magnetic spectrometers for fixed-target experiments 328
11.2 Magnetic spectrometers for special applications 336
11.3 Problems 342
References 344

12 Ageing and radiation effects 346
12.1 Ageing effects in gaseous detectors 346
12.2 Radiation hardness of scintillators 352
12.3 Radiation hardness of Cherenkov counters 354
12.4 Radiation hardness of silicon detectors 355
12.5 Problems 357
References 358

13 Example of a general-purpose detector: Belle 360
13.1 Detector components 361
13.1.1 The silicon vertex detector (SVD) 362
13.1.2 The central drift chamber (CDC) 364
13.1.3 The aerogel Cherenkov-counter system (ACC) 367
13.1.4 Time-of-flight counters (TOF) 369
13.1.5 Electromagnetic calorimetry (ECL) 372
13.1.6 The K_L and muon detection system (KLM) 377
13.2 Particle identification 379
13.3 Data-acquisition electronics and trigger system 382
13.4 Luminosity measurement and the detector performance 385
13.5 Problems 387
References 388

14 Electronics 390
14.1 Introduction 390
14.2 Example systems 391
14.3 Detection limits 395
14.4 Acquiring the sensor signal 397
14.4.1 Signal integration 397
14.5 Signal processing 402
14.6 Electronic noise 403

Published online by Cambridge University Press

14.6.1 Thermal (Johnson) noise 404
14.6.2 Shot noise 405
14.7 Signal-to-noise ratio versus sensor capacitance 405
14.8 Pulse shaping 406
14.9 Noise analysis of a detector and front-end amplifier 409
14.10 Timing measurements 415
14.11 Digital electronics 417
14.11.1 Logic elements 417
14.11.2 Propagation delays and power dissipation 419
14.11.3 Logic arrays 421
14.12 Analogue-to-digital conversion 421
14.13 Time-to-digital converters (TDCs) 425
14.14 Signal transmission 427
14.15 Interference and pickup 429
14.15.1 Pickup mechanisms 429
14.15.2 Remedial techniques 431
14.16 Conclusion 433
14.17 Problems 433
References 435

15 Data analysis 436
15.1 Introduction 436
15.2 Reconstruction of raw detector data 436
15.3 Analysis challenges 439
15.4 Analysis building blocks 441
15.4.1 Charged-particle trajectories 442
15.4.2 Energy reconstruction 446
15.4.3 Quark jets 447
15.4.4 Stable-particle identification 449
15.4.5 Displaced vertices and unstable-particle reconstruction 449
15.5 Analysis components 452
15.5.1 Monte Carlo event generators 452
15.5.2 Simulation of detector response 453
15.5.3 Beyond the detector 453
15.5.4 Multivariate techniques 455
15.6 Analysis in action 459
15.7 Problems 462
References 462

16 Applications of particle detectors outside particle physics 466
16.1 Radiation camera 467
16.2 Imaging of blood vessels 471

Published online by Cambridge University Press

16.3 Tumour therapy with particle beams 475
16.4 Surface investigations with slow protons 480
16.5 Gamma- and neutron-backscatter measurements 482
16.6 Tribology 484
16.7 Identification of isotopes in radioactive fallout 486
16.8 Search for hidden chambers in pyramids 487
16.9 Random-number generators using radioactive decays 489
16.10 Experimental proof of $\nu_e \neq \nu_\mu$ 492
16.11 Detector telescope for γ-ray astronomy 495
16.12 Measurement of extensive air showers with the Fly's Eye detector 497
16.13 Search for proton decay with water Cherenkov counters 500
16.14 Radio-carbon dating 501
16.15 Accident dosimetry 503
16.16 Problems 503
References 505

Résumé **510**

17 Glossary **512**

18 Solutions **533**

Appendix 1: Table of fundamental physical constants 577
Appendix 2: Definition and conversion of physical units 580
Appendix 3: Properties of pure and composite materials 582
Appendix 4: Monte Carlo event generators 584
Appendix 5: Decay-level schemes 591
Index 599
