## The Agricultural Climate of England and Wales

MAFF Technical Bulletin No 35

Of the various branches of knowledge which contribute to agricultural science, few can claim equal importance with meteorology. Certainly, no plans for agriculture can succeed without an accurate assessment of climatic risks. For the first time, details are published enabling estimates of meteorological averages for any area to be made, and probable variations considered. Advisers, planners, and administrators alike should find this book a source of valuable guidance. 'It is doubtful whether any other country in the world has published such a wealth of useful information of this character' – E S Carter, Deputy Director General, ADAS.

£2.40 (by post £2.58½)

### Tropical Pasture and Fodder Plants

A V Bogdan

This is a unique and valuable source of reference for all those concerned with agriculture, animal husbandry, ecology and soil science in tropical areas. Over 300 species of grasses and legumes are described in alphabetical order of botanical names. The information given on the more important plants includes: botanical and common names; climate and soil requirements; establishment; management; fertilising; yields; chemical composition and nutritive value; reproduction; and much more.

In the *Tropical Agriculture Series*

### An Introduction to the Botany of Tropical Crops.

SECOND EDITION

L B Cobley, revised by W M Steele

This widely used text has been revised and updated without major changes in content, except for the addition of a new first chapter introducing major features of the tropical environment where they influence crop distribution and farming. For each of the major crops theories of origin and spread are summarised, and there are descriptions of morphology, important aspects of physiology, husbandry, use and world production.
