

NEW AND MISCLASSIFIED PLANETARY NEBULAE

L. Kohoutek
Hamburg Observatory
Hamburg-Bergedorf, W.Germany

ABSTRACT. 75 objects have been classified as new planetary nebulae since 1982. They are summarized in Table 1 which gives the designations, names, coordinates and references to the discovery. In the list of misclassified PN (Table 2) 41 objects have been included; Table 3 presents objects with incorrect identification in CGPN. The main properties of a PN and of its nucleus are given in a summary which can be useful for a correct classification of planetaries.

This third supplementary list to the "Catalogue of Galactic Planetary Nebulae" (CGPN - Perek,Kohoutek,1967) contains 75 discoveries which were published mainly between 1982 and 1986. As in the previous lists the designations, names, coordinates and references to the discovery as PN are given in Table 1. An asterisk affixed to the galactic number means an uncertain classification (suspected, possible or probable PN).

It is suggested to remove 41 objects (Table 2) from the CGPN or from the previous supplementary lists (Kohoutek,1978 - Paper I, 1983 - Paper II):they are mostly M stars without H_α emission, galaxies, reflection nebulae or plate faults. There are numerous further objects the classification of which as PN is still questionable: it is possible to find them in both the list of planetaries and the list of other emission-line objects. The catalogue of symbiotic stars given by Allen (1984) contains 40 stars also classified as planetaries. We are rather reserved concerning their reclassification alone on the basis of symbiotic behaviours: let us mention the symbiotic object 330+4.1 (Cn 1-1) which was removed from the list of PN (Paper I) whereas the recent papers of Lutz (1984) and Bhatt,Mallik (1986) classify it again as a PN.

It is useful to present a list of planetary nebulae with incorrect identification in CGPN (Table 3). Besides

those objects given in this table we would like to point out 1-3.1 (H 1-47) and 1-3.2 (Ap 1-7): the identification of both objects is identical whereas the respective coordinates differ. Therefore the chart(s) must be incorrect.

In order to answer the question "what is not a PN" with the consequence to remove such an object from the respective list it is necessary to indicate what is a normal PN. We have therefore collected (using the current review literature) the main properties which correspond to the general conception of PN - in the following summary the typical values are given, but they are changing very much during the evolution of the nebulae and of their nuclei (the nebular parameters correspond to the main nebular structure). We believe that only a thorough discussion of all properties can lead to the decision whether or not the respective object belongs (with a certain probability) to the class of PN. For such a discussion not only extensive observations but also a comprehensive theory are necessary.

TABLE 3 MISIDENTIFIED PLANETARY NEBULAE

Design.	Name	Remarks and references
1 -0.1	B1 3-11	The CGPN identif.chart incorrect (Sanduleak, 1976). Misclassified PN (Paper II).
2 +1.1	H 2-20	Probably incorrect identification, the object is a AO star without em.lines (Lutz,Kaler,1983).
59 -1.1	He 1-3	Misidentified in CGPN, correct chart given by Sabbadin,Bianchini (1979).
164+31.1	NGC 2474/75	Not identical with NGC 2474/75 (Barbieri,Sulentic,1977). New name JnEr 1 proposed.
324 -1.1	He 2-133	Finding chart incorrect, the PN is located 1.5mm to the north and 1.2mm to the east of the star (AOV) indicated in the CGPN (Lutz,Kaler,1983).
353 +8.1	MyCn 26	A- or early F-type star,no em.lines.A misidentification or not a PN (Lutz,Kaler,1983).
355 +2.3	Th 3-11	Not correctly identified on the CGPN chart (Sanduleak,1976).
356 -0.1	Th 3-34	Lies Sp object marked on CGPN chart (Allen,1979).
358 +1.4	B1 B	Lies Np object marked on CGPN chart (Allen,1979).
358 -2.2	B1 3-6	Sanduleak (priv.comm.) finds the object 30"E of the identification given in CGPN (Allen,1979). Misclassified PN (Paper II).

PLANETARY NEBULA:

MORPHOLOGY:	symmetrical shape (mostly circular or elliptical disc or ring, sometimes bipolar structure) with apparently sharp outer boundary, often multiple shells (main nebula + faint outer structure or halo) <ul style="list-style-type: none"> -depending on: wavelength (stratification) intrinsic absorption -reflecting orientation in space
DIMENSION:	diam. $0.1\text{pc} - 0.2\text{pc}$ (limits $\sim 0.005\text{pc}, \sim 1\text{pc}$) <ul style="list-style-type: none"> -depending on wavelength (stratification)
EL.DENSITY:	$10^3\text{ cm}^{-3} - 10^4\text{ cm}^{-3}$ (but $< 10^3\text{ cm}^{-3}$ and $> 10^4\text{ cm}^{-3}$ possible for large and small nebulae)
EL.TEMPERATURE:	$9000^\circ\text{K} - 15000^\circ\text{K}$ (limits $8000^\circ\text{K}, 23000^\circ\text{K}$)
TOTAL MASS:	$0.1M_\odot - 0.2M_\odot$ (limits $\sim 0.001M_\odot, \sim 1M_\odot$)
EXP.VELOCITY:	non-isotropic, $\sim 25\text{km/s}$ (limits $4\text{km/s}, 60\text{km/s}$)
SPECTRUM:	<p>Em.lines:</p> <p>recombination lines mostly of H and He</p> <p>collisionally excited (forbidden) lines of C,N,O,Ne,Mg,Si,S,Cl,Ar</p> <p>fluorescent lines (rare) of OIII and NIII</p> <ul style="list-style-type: none"> -depending on: exc.conditions (exc.class) stratification chemical composition $I([OIII]5007+4959)/I(H\beta) \approx 1 \text{ to } 15$ $\approx 0 \text{ to } 1 \text{ for very low-exc.nebulae}$
CENTRAL STAR:	<p>Continuum emission:</p> <p>free-bound, free-free, two-quantum processes,</p> <p>emission from grains (dust)</p>

TEMPERATURE:	$50000^\circ\text{K} - 100000^\circ\text{K}$ (limits $25000^\circ\text{K}, \sim 200000^\circ\text{K}$)
LUMINOSITY:	$\sim 5 \times 10^3 L_\odot$ (limits $\sim 10^4 L_\odot, \sim 10^1 L_\odot$)
RADIUS:	limits $\sim 0.005R_\odot, \sim 1.5R_\odot$
MASS :	$\sim 0.6M_\odot$ (progenitors from $0.8M_\odot$ up to $6-8M_\odot$)
MASS LOSS:	$\sim 10^{-10} M_\odot/\text{yr} - 10^{-7} M_\odot/\text{yr}$
GRAVITY:	$\log g \sim 4.5 - 7.0$
SPECTRUM:	WR, Of, WR+Of, OVI, cont. O, sdO, peculiar
