A new approach of hand hygiene observation with focus on healthcare worker (HCW) category

Wee Ling Tee, National University Hospital, Singapore; Dale Fisher, Singapore National University Hospital, Singapore; Catherine Teo, Singapore National University Hospital, Singapore; Razali Bin Mahdi, Singapore National University Hospital, Singapore; Yvonne Lum, Singapore National University Hospital, Singapore

Objectives: The past hand hygiene (HH) compliance rate has indicated the low number of opportunities for some healthcare workers (HCWs) because the infection control liaison officer (ICLO) tended to capture opportunities from nurses who were available, despite the proportional allocation of opportunities per HCW type based on the World Health Organization (WHO) HH methodology. Therefore, HH compliance rates may not have accurately represented the specific HCW type, which may have affected the overall HH compliance rate. We sought to determine an accurate baseline of HH compliance rate with consistent number of opportunities across all HCW categories. Methods: HH auditors were ICLOs trained in HH observation by the infection control nurse (ICN) according to the WHO “My Five Moments of Hand Hygiene.” HH observations were conducted bimonthly with assigned areas focusing only on 1 HCW category for each session: nursing, medical, clinical support services, or environmental services. A briefing session was given on the day of observation, with the goal of collecting 20 opportunities per area with HCW focus during their peak activities. Direct feedback and positive reinforcement were given to HCWs after observations were completed. Results: A survey of 96 ICLOs indicated that observations based on HCW focus allowed them to capture more HH opportunities and concentrate on their observations. The new approach showed a significant increase in number of opportunities across all HCW categories that was more representative. We also successfully determined a new baseline for all HCW categories, with further breakdown of HH compliance rate.

Hospital-wide study to evaluate the tolerability and acceptability of alcohol-based hand rubs according to WHO protocol, and healthcare worker hand hygiene behavior during the COVID-19 pandemic

Yew Fong Lee, Sarawak General Hospital, Kuching, Malaysia; Wei Hong Lal, Clinical Research Centre, Institute for Clinical Research, National Institutes of Health, Kuching, Malaysia; Peh Yee Lee, Infection Prevention and Control Unit, Sarawak General Hospital Kuching, Malaysia; Samuel Choo Yew Ting, Pharmaceutical Services Division, Sarawak State Health Department, Kuching, Malaysia; Irena Albert Nuja, Infection Prevention and Control Unit, Sarawak General Hospital, Kuching, Malaysia; Hie Ung Ngian, Hospital Director’s Office, Sarawak General Hospital, Kuching, Malaysia; Jiacong Wang, Clinic for Infectious Diseases and Hospital Hygiene, University Hospital Zurich, Zurich, Switzerland

Objectives: To evaluate the tolerability and acceptability of 3 different alcohol-based hand rub (ABHR) products, and to determine factors influencing hand hygiene (HH) behavior among healthcare workers (HCWs) during the COVID-19 pandemic. Methods: A cross-sectional study was conducted in Sarawak General Hospital, a 1,034-bed tertiary-care state hospital. A self-administered 7-point Likert scale questionnaire was adapted from the WHO Protocol for Evaluation of Tolerability and Acceptability of ABHR. The study was conducted between November 12 and 26, 2021, based on 3 types of ABHR products. Participation in answering the questionnaire was voluntary, so consent was implied. The Student t test was used to determine the significant differences among the ABHR product. The χ2 distribution test was performed to evaluate the characteristics of ABHR products. Results: We received a response rate of 35% (1,598 of 4,628); 82% of respondents were female, and the overall cohort had a mean age of 35 years. Also, 972 (61%) of 1,598 respondents were nurses, and 1,490 (93%) of 1,598 respondents used ABHR at least 5 days every week. Of 1,598 respondents, 1,156 (72%) indicated that ABHR products were easily accessible at the point of patient care. Evaluation of ABHR products showed that respondents were receptive to all product colors (P < .0114) and had no color preference (P > .05). Comparison among ABHR products yielded no statistical difference (P > .05) for ‘smell’, ‘stickiness’, ‘irritation’, or ‘drying speed.’ ‘Drying effect’ of all products was statistically significant (P < .0252). The overall satisfaction for all products was good (P < .0022). HCWs did not expect their HH compliance to improve even if they were provided with their preferred choice of ABHR. Of 1,598 respondents, 783 (49%) correctly used a palm-full of ABHR for HH, and 1,275 (80%) indicated that hospital management was good (P < .0022). HCWs did not expect their HH compliance to improve even if they were provided with their preferred choice of ABHR.

12-hydroxysterac acid upregulates skin antimicrobial peptides in skin models and provides long-lasting protection from bacterial challenge from a handwash formulation

Morris Waskar, Unilever, India; Xuelan Gu, Unilever, Shanghai, China; Tingyan Mi, Unilever, Shanghai, China; Meenakshi Swaminathan, Unilever, Mumbai, India; Carol Vincent, Unilever, Trumbull, Connecticut, United States; Rimpa Ghosh, Unilever, Mumbai, India; Chandraprabha Doraissamy, Unilever, Bangalore, India; Amitabha Majumdar, Unilever, Bangalore, India

Objectives: We evaluated the role of 12-hydroxysterac acid (12HSA) in upregulating skin antimicrobial peptides (AMPs) in vitro and ex vivo.
enhancing skin provides long-lasting germ protection under in vivo test conditions by potentially

Results: These data demonstrate that 12HSA boosts skin–AMPs and that a handwash containing 12HSA provides long-lasting germ protection under in vivo test conditions by potentially enhancing skin’s natural immunity and AMPs, designing cleansing products that strengthen these natural defenses will offer novel approaches to extend hygiene benefits beyond immediate in-wash protection.

Conclusions: These data demonstrate that 12HSA boosts skin–AMPs and that a handwash containing 12HSA provides long-lasting germ protection under in vivo test conditions by potentially enhancing skin’s natural immunity and AMPs, designing cleansing products that strengthen these natural defenses will offer novel approaches to extend hygiene benefits beyond immediate in-wash protection.

Hand hygiene knowledge: Its effect on hand hygiene adherence rate during the COVID-19 pandemic in the primary care setting
Chau Chain Yan, National University Polyclinics, Singapore; Giselle Li, Singapore National University Polyclinics, Singapore

Objectives: Good hand hygiene knowledge among healthcare workers (HCWs) is important in the fight against COVID-19. The coronavirus disease is primarily spread through droplet and contact routes, so hand hygiene and PPE are key infection control measures to protect patients and HCWs. We sought to determine whether hand hygiene knowledge scores had an impact on the hand hygiene adherence rate during a pandemic. Methods: Hand hygiene audit observations that were conducted covertly on a monthly basis were examined in relation to HCW knowledge scores on hand hygiene. The knowledge scores on hand hygiene were analyzed based on 15 questions derived from WHO tools. Scores were determined using a quiz administered in a hand hygiene promotion event. Results: In total, 195 HCWs participated and scores on hand hygiene knowledge were ranked into 3 categories: 2% scored ≥90% (high), 60% scored 70–89% (medium), and 38% scored ≤70% (low). Knowledge scores at the medium level and above were considered satisfactory. Even though 38% of the participants scored ≤70%, there was no direct impact on monthly hand hygiene audit observation rates in the 6 healthcare clinics. Hand hygiene observation rates ranged from 90% to 97%, with an overall mean of 92% for 2021. Conclusions: Contrary to studies that have shown the significant impact of knowledge on the hand hygiene adherence rate, our data suggest that a high hand-hygiene adherence rate is achievable and sustainable among HCWs. Adherence could be driven by attention to the importance of hand hygiene associated with the pandemic and potential exposure to COVID-19. High hand-hygiene compliance attains a place of importance in the minds of HCWs during a pandemic crisis.

Implementation of infection prevention and control in Indonesian hospitals: Identification of strengths, gaps, and challenges in current practices
Indri Rooslamjati Supriadi, Ministry of Health of Indonesia, University Medical Centre Utrecht and Department of Medical Microbiology and Infectious Diseases, Erasmus University Medical Centre, Rotterdam, The Netherlands; Leli Saptawati, Department of Microbiology, Faculty of Medicine, Universitas Sebelas Maret, Surakarta, Indonesia and Department of Microbiology, Moeawardi Teaching Hospital, Surakarta, Indonesia, Indonesia; Nani H. Widodo, Directorate of Referral Health Care, Ministry of Health of Indonesia and National Working Group of Infection Prevention and Control, Ministry of Health of Indonesia, Jakarta, Indonesia; Hindra Irawan Satari, Cipto Mangunkusumo Hospital, Ministry of Health of Indonesia; Department of Child Health, Faculty of Medicine Universitas Indonesia, Jakarta, Indonesia, and National Working Group of Infection Prevention and Control, Ministry of Health of Indonesia, Jakarta, Indonesia; Gortap Sitohang, National Working Group of Infection Prevention and Control, Ministry of Health of Indonesia, Jakarta, Indonesia; Yusfely Usman, Jakarta, Center for Financing and Decentralization Policy, Health Resources, Health Development Policy Agency, Ministry of Health of Indonesia, Jakarta, Indonesia; Ida Bagus Anom, Directorate of Referral Health Care, Ministry of Health of Indonesia and National Working Group of Infection Prevention and Control, Ministry of Health of Indonesia, Jakarta, Indonesia; Ratih Dian Saraswati, Center for Health Policy on Resilience System and Resource, Health Development Policy Agency, Ministry of Health of Indonesia, Jakarta, Indonesia; Juliette A. Severin, Department of Medical Microbiology and Infectious Diseases, Erasmus University Medical Centre, Rotterdam, The Netherlands

Objectives: Infection prevention and control (IPC) in hospitals is key to safe patient care. Currently, no data are available regarding the implementation of IPC in hospitals in Indonesia. We assessed the existing IPC practices in a nationwide survey using the World Health Organization (WHO) IPC assessment framework tool (IPCaf) to identify strengths, weaknesses, and challenges. Methods: A cross-sectional study was conducted from July to November 2021. Of all general hospitals in Indonesia, 475 (20%) were selected using stratified random sampling based on class (ie, A, B, C, and D; A being the larger hospitals with ≥250 beds) and region. IPCaf was translated into Indonesian and was tested in 4 hospitals. Questions were added regarding challenges in the implementation of IPC. Introduction meetings were held online with all selected hospitals, after which the IPCaf was sent as an online questionnaire. Results: In total, 355 hospitals (74.7%) participated in this study. The overall median score of IPCaf was 632.5. The level of implementation of IPC was mostly advanced (56.9%), followed by intermediate (35.8%), basic (7.0%), and inadequate (0.3%). The core component with the highest scores was IPC guidelines; almost all hospitals had guidelines on the most important topics, including hand hygiene. Core components with the lowest scores were surveillance of healthcare-associated infections (HAIs), education and training, and multimodal strategies. Although >90% of hospitals indicated that surveillance of HAIs was performed, 57.2% reported no availability of adequate microbiology laboratory capacity to support HAi surveillance. The most reported challenges in the implementation of IPC were behavior change and lack of availability of antibiograms. Conclusions: The implementation of the IPC core components in most Indonesian hospitals was “advanced.” For surveillance of HAIs, the need for the availability and capability of the microbiology laboratory was revealed.
