Abstract. Suppose we are given complex manifolds X and Y together with substacks \mathcal{S} and \mathcal{S}' of modules over algebras of formal deformation \mathcal{A} on X and \mathcal{A}' on Y , respectively. Also, suppose we are given a functor Φ from the category of open subsets of X to the category of open subsets of Y together with a functor F of prestacks from \mathcal{S} to $\mathcal{S}' \circ \Phi$. Then we give conditions for the existence of a canonical functor, extension of F to the category of coherent \mathcal{A} -modules such that the cohomology associated to the action of the formal parameter \hbar takes values in \mathcal{S} . We give an explicit construction and prove that when the initial functor F is exact on each open subset, so is its extension. Our construction permits to extend the functors of inverse image, Fourier transform, specialisation and micro-localisation, nearby and vanishing cycles in the framework of $\mathcal{D}[[\hbar]]$ -modules. We also obtain the Cauchy–Kowalewskaia–Kashiwara theorem in the non-characteristic case as well as comparison theorems for regular holonomic $\mathcal{D}[[\hbar]]$ -modules and a coherency criterion for proper direct images of good $\mathcal{D}[[\hbar]]$ -modules.

2010 *Mathematics Subject Classification*. Primary: 32C38, 46L65; Secondary: 18E30, 46A13.

1. Introduction. On a complex manifold X we consider the sheaf \mathcal{D}_X of differential operators and the sheaf $\mathcal{D}_X[[\hbar]]$ (noted \mathcal{D}_X^\hbar for short) of formal differential operators on a parameter \hbar . For the main results on modules over \mathcal{D}_X we refer to [5] and for those on modules over \mathcal{D}_X^\hbar we refer to [8] and [2]. The notion of algebras of formal deformation and the main results that we need here were obtained in [8].

Our first motivation was to understand the behaviour of a coherent \mathcal{D}_X^\hbar -module near a submanifold Y . The natural tool is to define conveniently a functor of inverse image generalizing the \mathcal{D} -module case. Alternatively, one can also look for a generalization of the functor of specialization. Recall that inverse image on the category of \mathcal{D} -modules is not exact, unless we assume in addition that the objects are non-characteristic. On the other hand, specialization is an exact functor on the Serre subcategory of specializable \mathcal{D} -modules.

To treat inverse image turned out to be not too hard because one finds a natural candidate to play the role of transfer module as we shall see later. On the other hand, \mathcal{D}_X^h is not provided with a natural equivalent to the Kashiwara–Malgrange V -filtration, and specialization is far from being a mere copy of the \mathcal{D} -module case so that the study of its properties takes an important place in this work.

For a given sheaf \mathcal{A} of coherent rings one denotes by $\text{Mod}_{\text{coh}}(\mathcal{A})$ the abelian category of coherent left \mathcal{A} -modules. Let \mathbb{K} be a unital commutative Noetherian ring with finite global dimension.

The general problem then became the following:

Given two complex manifolds X and Y , together with two \mathbb{K} -algebras of formal deformation \mathcal{A} on X , and \mathcal{A}' on Y , given a right exact (respectively exact) functor F from a given full Serre subcategory \mathcal{S} of $\text{Mod}_{\text{coh}}(\mathcal{A})$ to a given full subcategory \mathcal{S}' of $\text{Mod}(\mathcal{A}')$, find the natural subcategory containing \mathcal{S} to which F extends canonically as a right exact (respectively exact) functor, let us say, F^h .

For each $n \in \mathbb{N}_0$ and for each left \mathcal{A} -module, consider the quotient $\mathcal{M}_n = \mathcal{M}/\hbar^{n+1}\mathcal{M}$ and, for $n \leq k$, denote by $\rho_{k,n}$ the projection $\mathcal{M}_n \rightarrow \mathcal{M}_k$. If one assumes that, for each n , $\mathcal{M}_n \in \mathcal{S}$, then the natural candidate $F^h(\mathcal{M})$ will be the projective limit

$$\varprojlim_n F(\mathcal{M}_n) \quad (1)$$

of the associated projective system $(F(\mathcal{M}_n), F(\rho_{k,n}))_n$. This construction will be the heart of our study.

To be rigorous, we will resort to the framework of stacks, and the reason is that we will be interested in Serre subcategories whose objects are defined by local properties. Recall that stacks provide the framework where the notion of sheaves of categories takes a sense. However, throughout this work, we only deal with the easiest example of stacks consisting precisely of sheaves of categories, since they are substacks of modules over a sheaf of \mathbb{K} -algebras and the restriction morphisms are nothing more than the usual restriction of sheaves to open subsets. In particular, all these stacks are $\mathbb{K}[[\hbar]]$ -linear, where \hbar denotes the central formal parameter in each of the algebras.

Recall that one denotes by $\text{Op}(X)$ the category of open subsets of X where the morphisms are defined by the inclusions. Let $\mathcal{M}od(\mathcal{A})$ denote the stack $U \mapsto \text{Mod}(\mathcal{A}|_U)$, $U \in \text{Op}(X)$. Given an abelian substack \mathcal{C} of $\mathcal{M}od(\mathcal{A})$, a full substack \mathcal{C}' of \mathcal{C} is said to be a full Serre substack if, for each $U \in \text{Op}(X)$, $\mathcal{C}'(U)$ is a full Serre subcategory of $\mathcal{C}(U)$.

Accordingly, in the sequel, \mathcal{S} will denote a full Serre substack of the stack $\mathcal{M}od_{\text{coh}}(\mathcal{A}) : U \mapsto \text{Mod}_{\text{coh}}(\mathcal{A}|_U)$. For the sake of simplicity, and whenever there is no ambiguity, we shall often say that a coherent $\mathcal{A}|_U$ -module defined on $U \in \text{Op}(X)$ belongs to \mathcal{S} if it belongs to $\mathcal{S}(U)$.

Let us now outline the main result of this work.

Assume that we are given a full Serre substack \mathcal{S} of $\mathcal{M}od_{\text{coh}}(\mathcal{A})$ and a full Serre substack \mathcal{S}' of $\mathcal{M}od(\mathcal{A}')$. Consider the category $\text{Mod}_{\mathcal{S}}(\mathcal{A})$ of $\text{Mod}_{\text{coh}}(\mathcal{A})$ characterized by the property that, for each n , the kernel and the cokernel of the action of \hbar^{n+1} belong to $\mathcal{S}(X)$. Assume that we are given a functor Φ from $\text{Op}(X)$ to $\text{Op}(Y)$ such that $\Phi(X) = Y$, and that Φ transforms any open covering of any $\Omega \in \text{Op}(X)$ on an open covering of $\Phi(\Omega)$. Denote by $\Phi^*\mathcal{S}'$ the prestack $U \mapsto \Phi^*\mathcal{S}' = \mathcal{S}'(\Phi(U))$ and assume that we are given a $\mathbb{K}[[\hbar]]$ -linear functor of prestacks $F : \mathcal{S} \rightarrow \Phi^*\mathcal{S}'$. This means, in particular, that for each pair $V, U \in \text{Op}(X)$ with $V \subset U$ we have the following

commutative diagram of functors of categories whose vertical arrows are the restriction functors:

$$\begin{array}{ccc} \mathcal{S}(U) & \xrightarrow{F(U)} & \mathcal{S}'(\Phi(U)) \\ \downarrow & & \downarrow \\ \mathcal{S}(V) & \xrightarrow{F(V)} & \mathcal{S}'(\Phi(V)). \end{array}$$

Here we prove the following (Theorem 4.24): If, for each $U \in \mathcal{O}p(X)$, $F(U) : \mathcal{S}(U) \rightarrow \mathcal{S}'(\Phi(U))$ is right exact (respectively exact), then under a condition on the vanishing of the cohomology for $\mathcal{S}'(V)$, with V running on the objects of $\mathcal{O}p(Y)$ (Condition 2.20), automatically fulfilled by coherent modules, by (1) we obtain a canonical functor $F^h : \text{Mod}_{\mathcal{S}}(\mathcal{A}) \rightarrow \text{Mod}(\mathcal{A}')$. Moreover, F^h is right exact (respectively exact).

Namely, when \mathcal{S}' is a substack of coherent \mathcal{A}' -modules, then F^h takes values in $\text{Mod}_{\mathcal{S}'}(\mathcal{A}')$. Moreover, if each $F(U)$ is exact, this extension is, in a certain sense, unique up to isomorphism.

The term ‘canonical’ means that our construction is indeed functorial in \mathcal{S} , \mathcal{S}' , Φ and F (cf. Remark 4.25).

After the preliminary results in Sections 1 and 2, we prove Theorem 4.24 in Section 3 using the following key facts:

- A right exact functor combined with the action of \hbar^{n+1} transforms, for each n , exact sequences of \mathcal{A} -modules into right exact sequences of \mathcal{A}'_n -modules.
- The exactness of $\Gamma(K, \cdot)$ for K belonging to adequate basis of the topologies on the manifolds for the categories that we consider.
- The exactness of projective limit on the category of projective systems satisfying the Mittag-Leffler condition.

In Section 4 we use Theorem 4.24 to treat the case of $\mathcal{A} = \mathcal{D}_X^h$ (respectively $\mathcal{A}' = \mathcal{D}_Y^h$). The situation is then simpler because the modules $\mathcal{D}_X^h / \hbar^{n+1} \mathcal{D}_X^h$ are free over $\mathcal{A}_0 \simeq \mathcal{D}_X$, so technically we are bound to extend a right exact functor F defined on a Serre substack \mathcal{S} of coherent \mathcal{D}_X -modules.

In this way we obtain a natural setting for the extensions of the functors of inverse image, direct image by a closed embedding, specialization, nearby and vanishing cycles, Fourier transform and micro-localization for \mathcal{D}_X^h -modules, which are performed in Section 5. Namely, in the case of the extended inverse image functor for a morphism f , when we restrict to the Serre substack of non-characteristic modules, we prove a formal version of the Cauchy–Kowalewskaia–Kashiwara theorem (Theorem 5.8). We also generalize the functor *extraordinary* inverse image using the concept of duality introduced in [2] and prove in Proposition 5.7 and Corollary 5.9 that the property of holonomicity (as well as that of regular holonomicity) is stable under inverse image (respectively extraordinary inverse image).

Moreover, for the extension of the specialization, micro-localization, vanishing and nearby cycles functors, when we restrict to the category of regular holonomic \mathcal{D}_X^h -modules in the sense of [2], we obtain comparison theorems which are the formal version of the results proved by Kashiwara in [4] (Theorems 5.36 and 5.43, and Corollaries 5.37 and 5.44).

Remaining natural questions are the (left) derivability of F^h as well as the extension of left exact functors.

For the first, a difficulty in constructing an F^h -projective subcategory comes certainly from the behaviour of the (left exact) functor \varprojlim for which we don't have in general enough injectives. This functor also lacks good properties with respect to the usual operations in sheaf theory. Therefore, even if there exists an F -projective subcategory \mathcal{P} , to our knowledge there is no canonical way of constructing an F^h -projective subcategory.

In what concerns direct images, which are defined as the composition of derived functors, one being left exact, the other being right exact, our method no longer applies except in particular cases such as closed embeddings. But there is another way, since we show that in the case of inverse image the extended functor can be given using a convenient transfer module as in \mathcal{D} -module theory. Once having available a good notion of transfer module, we can also obtain a natural extension of the functor of direct image. In this setting, we prove a formal version of the theorem of coherency of proper direct image for good \mathcal{D}^h -modules (Theorem 5.18).

So as a by-product of our general construction together with the results of [2], the so-called *Grothendieck's* six operations are generalized to the formal case.

Convention 1. The results in the first three sections, with few exceptions, hold in the more general context of Hausdorff locally compact topological spaces. For simplicity, in view of our motivations, we stay in the complex analytical setting.

2. Review on modules over formal deformations. In this section we recall the basic material that we need from [8].

Let X be a complex manifold of finite dimension d_X .

Let \mathbb{K} be a unital commutative Noetherian ring with finite global dimension. Recall that, for brevity, one denotes $\mathbb{C}[[\hbar]]$ by \mathbb{C}^h .

Given a sheaf \mathcal{R} of \mathbb{K} -algebras on X , we denote by $\text{Mod}(\mathcal{R})$ the category of left \mathcal{R} -modules by $D(\mathcal{R})$ the derived category of $\text{Mod}(\mathcal{R})$, and by $D^*(\mathcal{R})$ ($*$ = +, −, b) the full triangulated subcategory of $D(\mathcal{R})$ consisting of objects bounded from below (resp. bounded from above, resp. bounded) cohomology.

Recall that a full subcategory \mathcal{S} of an abelian category \mathcal{C} is thick if for any exact sequence

$$Y \rightarrow Y' \rightarrow X \rightarrow Z \rightarrow Z'$$

in \mathcal{C} with Y, Y', Z, Z' in \mathcal{S} , X belongs to \mathcal{S} .

Equivalently, \mathcal{S} is a full abelian subcategory such that, given a short exact sequence $0 \rightarrow X' \rightarrow X \rightarrow X'' \rightarrow 0$ in \mathcal{C} , when two of the objects X', X or X'' are in \mathcal{S} then the third also belongs to \mathcal{S} . Moreover, if \mathcal{S} contains all subobjects and quotient objects of its objects, then \mathcal{S} is called a Serre subcategory.

Let \mathcal{S} be a full thick subcategory of \mathcal{C} and let $D^b(\mathcal{C})$ be the bounded derived category of \mathcal{C} . One denotes by $D_{\mathcal{S}}^b(\mathcal{C})$ the full triangulated subcategory of $D^b(\mathcal{C})$ consisting of objects with cohomology in \mathcal{S} . In the cases listed below, we recall classical abbreviations.

EXAMPLE 2.1.

- The subcategory $\text{Mod}_{\text{coh}}(\mathcal{R})$ of coherent modules over a coherent ring \mathcal{R} is thick, and the associated category is denoted by $D_{\text{coh}}^b(\mathcal{R})$.

- The subcategory $\text{Mod}_{\mathbb{R}-c}(\mathbb{K}_X)$ of \mathbb{R} -constructible sheaves of \mathbb{K} -modules is a thick subcategory of $\text{Mod}(\mathbb{K}_X)$ and the associated category is denoted by $D_{\mathbb{R}-c}^b(\mathbb{K}_X)$.

For a complex manifold X , the following are Serre subcategories of $\text{Mod}_{coh}(\mathcal{D}_X)$:

- The subcategory $\text{Mod}_{good}(\mathcal{D}_X)$ of good \mathcal{D}_X -modules and the associated category is denoted by $D_{good}^b(\mathcal{D}_X)$.
- The subcategory $\text{Mod}_{hol}(\mathcal{D}_X)$ of holonomic \mathcal{D}_X -modules and the subcategory $\text{Mod}_{rh}(\mathcal{D}_X)$ of regular holonomic \mathcal{D}_X -modules and the associated categories are respectively denoted by $D_{hol}^b(\mathcal{D}_X)$ and $D_{rh}^b(\mathcal{D}_X)$.
- The subcategory $NC(f)$ of non-characteristic \mathcal{D}_X -modules with respect to a given holomorphic function $f: Y \rightarrow X$, where Y is another complex manifold and the associated category is denoted by $D_{NC(f)}^b(\mathcal{D}_X)$.
- The subcategory $\text{Mod}_{sp}(\mathcal{D}_X)$ of \mathcal{D}_X -modules specializable along a given submanifold Y and the associated category is denoted $D_{sp}^b(\mathcal{D}_X)$.

Given a sheaf \mathcal{M} of $\mathbb{Z}_X[\hbar]$ -modules, set $\mathcal{M}_n = \mathcal{M}/\hbar^{n+1}\mathcal{M}$ and for $n \geq k$ let $\rho_{k,n}: \mathcal{M}_n \rightarrow \mathcal{M}_k$ denote the canonical epimorphisms. One says that \mathcal{M} is \hbar -torsion free if $\hbar: \mathcal{M} \rightarrow \mathcal{M}$ is injective and one says that \mathcal{M} is \hbar -complete if the canonical morphism $\mathcal{M} \rightarrow \varprojlim_{n \geq 0} \mathcal{M}_n$ is an isomorphism.

A family \mathcal{B} of compact subsets of X is said to be the basis of compact subsets of X if for any $x \in X$ and any open neighbourhood U of x , there exists $K \in \mathcal{B}$ such that $x \in \text{Int}(K) \subset U$.

In the following we shall consider a \mathbb{K} -algebra \mathcal{A} on X and a section \hbar of \mathcal{A} contained in the centre of \mathcal{A} . Set $\mathcal{A}_0 = \mathcal{A}/\hbar\mathcal{A}$.

Consider the following conditions:

1. \mathcal{A} is \hbar -torsion free and \hbar -complete.
2. \mathcal{A}_0 is a left Noetherian ring.
3. There exists a basis \mathcal{B} of open subsets of X such that for any $U \in \mathcal{B}$ and any coherent $(\mathcal{A}_0|_U)$ -module \mathcal{F} we have $H^n(U; \mathcal{F}) = 0$ for any $n > 0$.
4. There exists a basis \mathcal{B} of compact subsets of X and a prestack $U \mapsto \text{Mod}_{good}(\mathcal{A}_0|_U)$ (U open in X) such that
 - (a) for any $K \in \mathcal{B}$ and an open subset U such that $K \subset U$, there exists $K' \in \mathcal{B}$ such that $K \subset \text{Int}(K') \subset K' \subset U$;
 - (b) $U \mapsto \text{Mod}_{good}(\mathcal{A}_0|_U)$ is a full subprestack of $U \mapsto \text{Mod}_{coh}(\mathcal{A}_0|_U)$;
 - (c) for an open subset U and $\mathcal{M} \in \text{Mod}_{coh}(\mathcal{A}_0|_U)$ if $\mathcal{M}|_V$ belongs to $\text{Mod}_{good}(\mathcal{A}_0|_V)$ for any relatively compact open subset V of U , then \mathcal{M} belongs to $\text{Mod}_{good}(\mathcal{A}_0|_U)$;
 - (d) for any U open in X , $\text{Mod}_{good}(\mathcal{A}_0|_U)$ is stable by subobjects (and hence by quotients) in $\text{Mod}_{coh}(\mathcal{A}_0|_U)$,
 - (e) for any $K \in \mathcal{B}$, any open set U containing K , any $\mathcal{M} \in \text{Mod}_{good}(\mathcal{A}_0|_U)$ and any $j > 0$, one has $H^j(K; \mathcal{M}) = 0$;
 - (f) for any $\mathcal{M} \in \text{Mod}_{coh}(\mathcal{A}_0|_U)$, there exists an open covering $U = \bigcup_i U_i$ such that $\mathcal{M}|_{U_i} \in \text{Mod}_{good}(\mathcal{A}_0|_{U_i})$,
 - (g) $\mathcal{A}_0 \in \text{Mod}_{good}(\mathcal{A}_0)$.

We shall say that \mathcal{A} is an algebra of formal deformation if \mathcal{A} and \mathcal{A}_0 satisfy either Assumption 2.2 or Assumption 2.3 given below.

Assumption 2.2. \mathcal{A} and \mathcal{A}_0 satisfy conditions (1), (2) and (3) above.

Assumption 2.3. \mathcal{A} and \mathcal{A}_0 satisfy conditions (1), (2) and (4) above.

In particular, with Assumption 2.2 or Assumption 2.3, \mathcal{A} and \mathcal{A}_n are left Noetherian rings, for every $n \geq 0$ (see Lemma 1.2.3 and Theorems 1.2.5 and 1.3.6 of [8]).

One defines a right exact functor assigning the object $\mathcal{M}/\hbar^{n+1}\mathcal{M} \in \text{Mod}(\mathcal{A}_n)$ to $\mathcal{M} \in \text{Mod}(\mathcal{A})$. Its left derived functor is given by

$$\begin{aligned} gr_{\hbar}^n : D^b(\mathcal{A}) &\rightarrow D^b(\mathcal{A}_n), \\ \mathcal{M} &\mapsto \mathcal{M} \otimes_{\mathcal{A}}^L \mathcal{A}_n. \end{aligned}$$

Recall that the functor gr_{\hbar}^0 was defined and studied in [8] and noted by gr_{\hbar} . For $\mathcal{M} \in \text{Mod}(\mathcal{A})$ one sets:

$${}_n\mathcal{M} = \ker(\mathcal{M} \xrightarrow{\hbar^{n+1}} \mathcal{M}).$$

Recall that a coherent \mathcal{A} -module is a locally finitely generated \mathcal{A} -module \mathcal{M} such that, for any open subset $U \subset X$ and for each locally finitely generated submodule \mathcal{M}' of $\mathcal{M}|_U$, locally \mathcal{M}' admits a finite free presentation.

If \mathcal{M} is a coherent \mathcal{A} -module then ${}_n\mathcal{M}$ and \mathcal{M}_n are coherent \mathcal{A}_n -modules.

Recall that, for each $n \geq 0$, the category $\text{Mod}(\mathcal{A}_n)$ and the full subcategory of $\text{Mod}(\mathcal{A})$ whose objects are those \mathcal{M} such that $\hbar^{n+1}\mathcal{M} \simeq 0$ are equivalent. Moreover:

LEMMA 2.4. ([8], Lemma 1.2.3) *Let $n \geq 0$. An \mathcal{A}_n -module \mathcal{M} is coherent as an \mathcal{A}_n -module if and only if it is so as an \mathcal{A} -module.*

Suppose that the property (4) in Assumption 2.3 holds. Denote by $D_{\text{good}}^b(\mathcal{A}_0)$ the full triangulated subcategory of $D^b(\mathcal{A}_0)$ consisting of objects with cohomology in $\text{Mod}_{\text{good}}(\mathcal{A}_0)$. One says that $\mathcal{M} \in D_{\text{coh}}^b(\mathcal{A})$ is good if $gr_{\hbar}(\mathcal{M}) \in D_{\text{good}}^b(\mathcal{A}_0)$. One denotes by $D_{\text{good}}^b(\mathcal{A})$ the full subcategory of $D_{\text{coh}}^b(\mathcal{A})$ consisting of good objects.

THEOREM 2.5. ([8], Theorem 1.3.6) *For any good \mathcal{A} -module \mathcal{M} and any $K \in \mathcal{B}$, we have $H^j(K; \mathcal{M}) = 0$ for any $j > 0$.*

THEOREM 2.6. ([8], Theorem 1.3.6) *An \mathcal{A} -module \mathcal{M} is coherent if and only if it is \hbar -complete and $\hbar^n\mathcal{M}/\hbar^{n+1}\mathcal{M}$ is a coherent \mathcal{A}_0 -module for any $n \geq 0$.*

For a sheaf \mathcal{R} of $\mathbb{Z}[\hbar]$ -algebras, set $\mathcal{R}^{\text{loc}} := \mathcal{R} \otimes_{\mathbb{Z}[\hbar]} \mathbb{Z}_X[\hbar, \hbar^{-1}]$. Following [8], $\mathcal{M} \in D^b(\mathcal{R})$ is said to be a cohomologically \hbar -complete object if $R\mathcal{H}\text{om}_{\mathcal{R}}(\mathcal{R}^{\text{loc}}, \mathcal{M}) \simeq R\mathcal{H}\text{om}_{\mathbb{Z}_X[\hbar]}(\mathbb{Z}_X[\hbar, \hbar^{-1}], \mathcal{M}) = 0$. We shall use for short the symbol chc to distinguish cohomologically \hbar -complete objects.

REMARK 2.7. The category of chc objects is a full triangulated subcategory of $D^b(\mathcal{R})$. Namely, if in a distinguished triangle two of the terms are chc , then the third is also chc .

Recall that any $\mathcal{M} \in D_{\text{coh}}^b(\mathcal{A})$ is chc .

For convenience, we denote by \mathcal{C} the subcategory of chc -modules of $\text{Mod}(\mathbb{Z}_X[\hbar])$.

LEMMA 2.8. *\mathcal{C} is a full abelian thick subcategory of $\text{Mod}(\mathbb{Z}_X[\hbar])$.*

Proof. By the remark above it remains to prove that \mathcal{C} is closed under kernels and cokernels. Given a morphism $f : A \rightarrow B$ in \mathcal{C} , the mapping cone $M(f)$ is chc in

$D^b(\mathbb{Z}_X[\hbar])$, so from the distinguished triangle

$$\ker f[1] \rightarrow M(f) \rightarrow \operatorname{coker} f \xrightarrow{+1}$$

we derive a distinguished triangle:

$$\begin{aligned} R\mathcal{H}\operatorname{om}_{\mathbb{Z}_X[\hbar]}(\mathbb{Z}_X[\hbar, \hbar^{-1}], \ker f[1]) &\rightarrow R\mathcal{H}\operatorname{om}_{\mathbb{Z}_X[\hbar]}(\mathbb{Z}_X[\hbar, \hbar^{-1}], M(f)) \rightarrow \\ &\rightarrow R\mathcal{H}\operatorname{om}_{\mathbb{Z}_X[\hbar]}(\mathbb{Z}_X[\hbar, \hbar^{-1}], \operatorname{coker} f) \xrightarrow{+1}. \end{aligned}$$

Besides, $\mathbb{Z}[\hbar, \hbar^{-1}]$ is a $\mathbb{Z}[\hbar]$ -module with projective dimension ≤ 1 , so

$$R^j\mathcal{H}\operatorname{om}_{\mathbb{Z}_X[\hbar]}(\mathbb{Z}_X[\hbar, \hbar^{-1}], \operatorname{coker} f) = 0, \text{ for } j \neq 0, 1$$

$$R^j\mathcal{H}\operatorname{om}_{\mathbb{Z}_X[\hbar]}(\mathbb{Z}_X[\hbar, \hbar^{-1}], \ker f) = 0, \text{ for } j \neq 0, 1.$$

The result follows from the long exact sequence attached to the preceding triangle. \square

THEOREM 2.9 ([8], Theorem 1.6.4). *Let $\mathcal{M} \in D^b(\mathcal{A})$ and assume that \mathcal{M} is \hbar c and $\operatorname{gr}_{\hbar}(\mathcal{M})$ is an object of $D_{\operatorname{coh}}^b(\mathcal{A}_0)$. Then \mathcal{M} is an object of $D_{\operatorname{coh}}^b(\mathcal{A})$ and we have the isomorphisms*

$$H^i(\mathcal{M}) \simeq \varprojlim_{n \geq 0} H^i(\operatorname{gr}_{\hbar}^n(\mathcal{M})). \quad (2)$$

THEOREM 2.10 ([8], Theorem 1.6.6). *Assume that $\mathcal{A}^{op}/\hbar\mathcal{A}^{op}$ is a Noetherian ring. Let \mathcal{M} be a \hbar c \mathcal{A} -module with no \hbar -torsion such that $\mathcal{M}/\hbar\mathcal{M}$ is a flat \mathcal{A}_0 -module. Then \mathcal{M} is a flat \mathcal{A} -module.*

PROPOSITION 2.11 ([8], Corollary 1.5.9). *The functor $\operatorname{gr}_{\hbar}$ is conservative in the category of \hbar c objects. In particular, it is conservative in $D_{\mathbb{R}-c}^b(\mathbb{C}_X^{\hbar}) \rightarrow D_{\mathbb{R}-c}^b(\mathbb{C}_X)$ and in $D_{\operatorname{coh}}^b(\mathcal{A}) \rightarrow D_{\operatorname{coh}}^b(\mathcal{A}_0)$.*

PROPOSITION 2.12 ([8], Corollary 1.5.7). *Assume that $\mathcal{M} \in \operatorname{Mod}(\mathcal{A})$ is \hbar -complete and \hbar -torsion free. Assume that there exists a basis \mathcal{B} of open (respectively of compact) subsets Ω such that $H^i(\Omega; \mathcal{M}) = 0$ for $i > 0$. Then \mathcal{M} is \hbar c.*

PROPOSITION 2.13 ([8], Proposition 1.5.10). *If $\mathcal{M} \in D^b(\mathcal{A})$ is \hbar c, then $R\mathcal{H}\operatorname{om}_{\mathcal{A}}(\mathcal{N}, \mathcal{M})$ is \hbar c, for any $\mathcal{N} \in D(\mathcal{A})$.*

PROPOSITION 2.14 ([8], Proposition 1.5.12). *Let $f : X \rightarrow Y$ be a morphism of complex manifolds, and suppose that $\mathcal{M} \in D^b(\mathcal{A})$ is \hbar c. Then $Rf_*\mathcal{M}$ is also \hbar c.*

Let now $f : Y \rightarrow X$ be a morphism of complex manifolds, and let us consider the canonical morphisms:

$$f_{\pi} : X \times_Y T^*Y \rightarrow T^*Y \text{ and } f_d : X \times_Y T^*Y \rightarrow T^*X.$$

Recall that f is said to be non-characteristic for an object $F \in D^b(\mathbb{K}_X)$ if

$$f_{\pi}^{-1}(SS(F)) \cap \ker f_d \subset Y \times_X T_X^*X,$$

where $SS(F)$ denotes the micro-support of F . We refer to [6] for a detailed study of the notion of micro-support.

We shall also need, in addition, the result mentioned below.

PROPOSITION 2.15. *Let $f : Y \rightarrow X$ be a morphism of complex manifolds.*

- (i) *Assume that a chc object $\mathcal{M} \in D^b(\mathbb{Z}_X[\hbar])$ is non-characteristic for f . Then $f^{-1}\mathcal{M}$ is chc.*
- (ii) *For every $\mathcal{M} \in D^b(\mathbb{Z}_X[\hbar])$, one has $\mathrm{gr}_{\hbar}(f^{-1}\mathcal{M}) \simeq f^{-1}\mathrm{gr}_{\hbar}(\mathcal{M})$.*

Proof.

- (i) By [6, Proposition 5.4.13(ii)], the result follows from the isomorphism

$$R\mathcal{H}om_{\mathbb{Z}_Y[\hbar]}(\mathbb{Z}_Y[\hbar, \hbar^{-1}], f^! \mathcal{M}) \simeq f^! R\mathcal{H}om_{\mathbb{Z}_X[\hbar]}(\mathbb{Z}_X[\hbar, \hbar^{-1}], \mathcal{M}).$$

- (ii) It is clear. □

For $\mathcal{M} \in \mathrm{Mod}(\mathcal{A})$ one denotes by $\mathcal{M}_{\hbar\text{-tor}}$ the submodule of \mathcal{M} consisting of sections locally annihilated by some power of \hbar and by $\mathcal{M}_{\hbar\text{-gf}}$ the quotient $\mathcal{M}/\mathcal{M}_{\hbar\text{-tor}}$. Thus, the following sequence:

$$0 \rightarrow \mathcal{M}_{\hbar\text{-tor}} \rightarrow \mathcal{M} \rightarrow \mathcal{M}_{\hbar\text{-gf}} \rightarrow 0 \quad (3)$$

is exact.

$\mathcal{M} \in \mathrm{Mod}(\mathcal{A})$ is said to be an \hbar -torsion module if $\mathcal{M}_{\hbar\text{-tor}} \simeq \mathcal{M}$ and \mathcal{M} is \hbar -torsion free if and only if $\mathcal{M} \simeq \mathcal{M}_{\hbar\text{-gf}}$. In particular, for each $n \geq 0$, \mathcal{M}_n is an \hbar -torsion module since $\hbar^{n+1}\mathcal{M}_n = 0$.

Note that $\mathcal{M}_{\hbar\text{-tor}}$ is also the increasing union of the ${}_n\mathcal{M}$'s. If \mathcal{M} is coherent, the family $\{{}_n\mathcal{M}\}_n$ is locally stationary, so locally there exists $N \geq 1$ such that $\hbar^N \mathcal{M}_{\hbar\text{-tor}} = 0$ and both $\mathcal{M}_{\hbar\text{-tor}}$ and $\mathcal{M}_{\hbar\text{-gf}}$ are coherent \mathcal{A} -modules.

In particular, an \hbar -torsion \mathcal{A} -module is coherent as an \mathcal{A} -module if and only if, locally, it is coherent as an \mathcal{A}_n -module for n big enough.

If \mathcal{M} is a coherent \mathcal{A} -module, then each \mathcal{M}_n is coherent as an \mathcal{A} -module, thus as an \mathcal{A}_n -module.

LEMMA 2.16. *Let $0 \rightarrow \mathcal{M}' \rightarrow \mathcal{M} \rightarrow \mathcal{M}'' \rightarrow 0$ be an exact sequence in $\mathrm{Mod}(\mathcal{A})$, and suppose that \mathcal{M}'' is \hbar -torsion free. Then for each $n \geq 0$, the associated sequence of \mathcal{A}_n -modules:*

$$0 \rightarrow \mathcal{M}'_n \rightarrow \mathcal{M}_n \rightarrow \mathcal{M}''_n \rightarrow 0 \quad (4)$$

is exact.

Proof. For each $n \geq 0$, applying gr_{\hbar}^n to $0 \rightarrow \mathcal{M}' \rightarrow \mathcal{M} \rightarrow \mathcal{M}'' \rightarrow 0$, we deduce the long exact sequence

$$0 \rightarrow {}_n\mathcal{M}' \rightarrow {}_n\mathcal{M} \rightarrow {}_n\mathcal{M}'' \rightarrow \mathcal{M}'_n \rightarrow \mathcal{M}_n \rightarrow \mathcal{M}''_n \rightarrow 0.$$

By assumption ${}_n\mathcal{M}'' = 0$ and the result follows. □

COROLLARY 2.17. *Let \mathcal{M} be an \mathcal{A} -module. Then for each $n \geq 0$, the following sequence is exact:*

$$0 \rightarrow \mathcal{M}_{\hbar\text{-tor}n} \rightarrow \mathcal{M}_n \rightarrow \mathcal{M}_{\hbar\text{-gf}n} \rightarrow 0. \quad (5)$$

Let $\mathcal{M} \in \text{Mod}(\mathcal{A})$, let $n' \geq n - k$ and denote by $\overline{h^k} : \mathcal{M}_{n'} \rightarrow \mathcal{M}_n$ the morphism defined by the multiplication by h^k . Observe that the action of $\overline{h^k}$ in \mathcal{M}_n coincides with the composition of the chain of morphisms

$$\mathcal{M}_n \xrightarrow{\overline{h^k}} \mathcal{M}_{n+k} \xrightarrow{\rho_{n,n+k}} \mathcal{M}_n.$$

LEMMA 2.18. *For each $n \geq k \geq 1$ and each $n' \geq n - k$ one has an exact sequence:*

$$\mathcal{M}_{n'} \xrightarrow{\overline{h^k}} \mathcal{M}_n \xrightarrow{\rho_{k-1,n}} \mathcal{M}_{k-1} \rightarrow 0. \quad (6)$$

Proof. Clearly $\ker(\rho_{k-1,n}) = \overline{h^k} \mathcal{M} / \overline{h^{n+1}} \mathcal{M} = \overline{h^k}(\mathcal{M}_{n'})$. \square

LEMMA 2.19. *Let \mathcal{M} be an \hbar -complete \mathcal{A} -module. Then \mathcal{M} is \hbar -torsion free if and only if for every $n \geq 0$ the sequence below is exact:*

$$0 \rightarrow \mathcal{M}_0 \xrightarrow{\overline{h^n}} \mathcal{M}_n \xrightarrow{\hbar} \mathcal{M}_n. \quad (7)$$

Proof. If \mathcal{M} is \hbar -torsion free, (7) is clearly exact since, for $m, m' \in \mathcal{M}$, the equality $\hbar^n m = \hbar^{n+1} m'$ entails $m = \hbar m'$.

Conversely, assume that for every $n \geq 0$ we have the exact sequence (7). Thus, given $(v_n)_n \in \mathcal{M}$ such that $\hbar v_n = 0$, $\forall n$, it follows that $v_n = \overline{h^n} u_{0n}$ for some (unique) $u_{0n} \in \mathcal{M}_0$ and we may choose $u_n \in \mathcal{M}_n$ such that $v_n = h^n u_n$, $\forall n$. On the other hand, $v_n = \rho_{nn'}(v_{n'})$, $\forall n' \geq n$, hence $v_n = \rho_{nn'}(\hbar^{n'} u_{n'}) = \hbar^{n'} \rho_{nn'}(u_{n'}) = 0$ since we may take $n' \geq n + 1$. \square

Given a full substack $\mathcal{C} : U \mapsto \mathcal{C}(U)$ of $\text{Mod}(\mathcal{A})$ of abelian subcategories, we shall consider the following condition defining a full Serre substack \mathcal{S} of \mathcal{C} .

Condition 2.20. For each U , \mathcal{M} belongs to $\mathcal{S}(U)$ if and only if, for each $x \in U$, there exists a neighbourhood $V \subset U$ of x such that for any submodule \mathcal{N} of \mathcal{M} belonging to $\mathcal{C}(V)$ (and hence for any quotient \mathcal{N} of \mathcal{M} belonging to $\mathcal{C}(V)$) if $K \in \mathcal{B}$ is contained in V , then

$$H^j(K; \mathcal{N}) = 0, \text{ for any } j > 0. \quad (8)$$

In particular, if $\mathcal{C} = \text{Mod}_{\text{coh}}(\mathcal{A})$, then $\mathcal{S} = \mathcal{C}$.

LEMMA 2.21. *Let $\mathcal{M} \in \text{Mod}(\mathcal{A})$ and suppose that \mathcal{M}_0 belongs to $\mathcal{S}(X)$. Let $(V_i)_i$ be an open covering of X where Condition 2.20 is satisfied by \mathcal{M}_0 . Then if $K \in \mathcal{B}$ is contained in V_i , one has:*

1. $H^j(K; \mathcal{M}_n) = 0$, $\forall j > 0$, $n \geq 0$;
 2. $H^j(K; \varprojlim_n \mathcal{M}_n) = 0$, $\forall j > 0$. In particular, if \mathcal{M} is \hbar -complete, one also has
- $$H^j(K; \mathcal{M}) = 0, \forall j > 0.$$

Proof. (1): Let us consider, for each $n \in \mathbb{N}$, the exact sequence:

$$h^n \mathcal{M} / h^{n+1} \mathcal{M} \rightarrow \mathcal{M}_n \xrightarrow{\rho_{0,n}} \mathcal{M}_{n-1} \rightarrow 0.$$

Since $h^n\mathcal{M}/h^{n+1}\mathcal{M}$ is the image of the morphism $\overline{h^n} : \mathcal{M}_0 \rightarrow \mathcal{M}_n$, then it is also a quotient of \mathcal{M}_0 . Thus, starting with \mathcal{M}_0 , the result follows by induction on n .

(2): By (1), when \mathcal{B} is a basis of open sets, the statement is clear. When \mathcal{B} is a basis of compact sets, we may consider a fundamental system of compact neighbourhoods $\tilde{K} \in \mathcal{B}$ of K in V_i . For any j , we have $H^j(K, \varprojlim_n \mathcal{M}_n) \simeq \varinjlim_{\tilde{K}} H^j(\tilde{K}, \varprojlim_n \mathcal{M}_n)$.

Since the map $H^j(\tilde{K}, \varprojlim_n \mathcal{M}_n) \rightarrow H^j(K, \varprojlim_n \mathcal{M}_n)$ factors by

$$H^j(\tilde{K}, \varprojlim_n \mathcal{M}_n) \rightarrow H^j(\tilde{K}, \varprojlim_n (\mathcal{M}_n|_{\tilde{K}})) \rightarrow H^j(K, \varprojlim_n \mathcal{M}_n),$$

it remains to observe that $H^j(\tilde{K}, \varprojlim_n \mathcal{M}_n|_{\tilde{K}}) = 0$, for $j > 0$, as a consequence of (1) and of [6, Exercise II.12.b]. \square

3. The category $\text{Mod}_{\mathcal{S}}(\mathcal{A})$. In this section we prepare the notions needed for our main result (cf. Theorem 4.24). Since we shall deal with subcategories of sheaves whose objects are described by local properties, the convenient language is that of stacks. Moreover, since on each open subset $U \subset X$ we deal with categories of sheaves which are abelian subcategories of modules over some sheaf of rings defined on X , and the restriction morphisms are the usual restriction of sheaves to open subsets, our stacks are in fact sheaves of categories. A fortiori we deal with \mathbb{K} -linear stacks. For the background on stacks we refer to [7].

Let \mathcal{A} be an algebra of formal deformation on a complex manifold X , and let there be given and fixed in the sequel a $\mathbb{K}[[h]]$ -linear full Serre substack $\mathcal{S} : U \mapsto \mathcal{S}(U)$ of $\text{Mod}_{\text{coh}}(\mathcal{A})$. By convenience, for each $n \in \mathbb{N}_0$, we shall denote by \mathcal{S}_n the substack of $\text{Mod}_{\text{coh}}(\mathcal{A}_n)$:

$$U \mapsto \mathcal{S}_n(U) := \mathcal{S}(U) \cap \text{Mod}(\mathcal{A}_n|_U).$$

Hence, for each open subset $U \subset X$ and each $n \in \mathbb{N}_0$, $\mathcal{S}_n(U)$ is a full Serre subcategory of $\text{Mod}_{\text{coh}}(\mathcal{A}_n|_U)$.

Convention 3.1. In view of our applications, if there is no ambiguity, given an open subset $U \subset X$ and $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{A}|_U)$, we shall often use the notation $\mathcal{M} \in \mathcal{S}$ (resp. $\mathcal{M} \in \mathcal{S}_n$) to mean that $\mathcal{M} \in \mathcal{S}(U)$ (resp. $\mathcal{M} \in \mathcal{S}_n(U)$). Furthermore, we denote by $D_{\mathcal{S}}^b(\mathcal{A})$ the full triangulated subcategory of $D^b(\mathcal{A})$ consisting of objects with cohomology in \mathcal{S} .

According to the above convention:

DEFINITION 3.2. We denote by $\text{Mod}_{\mathcal{S}}(\mathcal{A})$ the full subcategory of $\text{Mod}_{\text{coh}}(\mathcal{A})$ consisting of \mathcal{A} -modules \mathcal{M} such that:

For each $n \geq 0$, the complex $gr_h^n(\mathcal{M})$ belongs to $D_{\mathcal{S}}^b(\mathcal{A})$, that is, both ${}_n\mathcal{M}$ and \mathcal{M}_n are objects of \mathcal{S}_n .

Since each $\mathcal{M} \in \text{Mod}_{\mathcal{S}}(\mathcal{A})$ is coherent, the sequence $({}_n\mathcal{M})_n$ is locally stationary, in other words \mathcal{M}_{h-tor} is locally annihilated by a fixed power h^N .

PROPOSITION 3.3.

1. $\mathcal{S}(X)$ is a subcategory of $\text{Mod}_{\mathcal{S}}(\mathcal{A})$.

2. Let \mathcal{M} be an \hbar -torsion \mathcal{A} -module such that $\mathcal{M} \in \text{Mod}_{\mathcal{S}}(\mathcal{A})$. Then $\mathcal{M} \in \mathcal{S}(X)$.

Proof.

(1): Let $\mathcal{M} \in \mathcal{S}(X)$. For $n \in \mathbb{N}_0$ we have the exact sequences:

$$0 \rightarrow \hbar^{n+1}\mathcal{M} \rightarrow \mathcal{M} \rightarrow \mathcal{M}_n \rightarrow 0$$

and

$$0 \rightarrow_n \mathcal{M} \rightarrow \mathcal{M} \rightarrow \hbar^{n+1}\mathcal{M} \rightarrow 0,$$

thus ${}_n\mathcal{M}$ and \mathcal{M}_n belong to $\mathcal{S}(X)$.

(2): We have $\mathcal{M} \simeq \mathcal{M}_{\hbar\text{-tor}}$, hence we can cover X by open subsets U and choose positive integers N_U such that $\hbar^{N_U+1}\mathcal{M}|_U = 0$. Thus, $\mathcal{M}|_U \simeq \mathcal{M}_{N_U}|_U \in \mathcal{S}_{N_U}(U) \subset \mathcal{S}(U)$ so $\mathcal{M} \in \mathcal{S}(X)$ since \mathcal{S} is a stack. \square

PROPOSITION 3.4. *Let \mathcal{M} be a coherent \mathcal{A} -module. Then the following properties are equivalent:*

- (1) \mathcal{M} is an object of the category $\text{Mod}_{\mathcal{S}}(\mathcal{A})$;
- (2) $\mathcal{M}_0 \in \mathcal{S}_0$;
- (3) $\mathcal{M}_n \in \mathcal{S}_n$, for each $n \geq 0$.

Proof.

(1 \Rightarrow 2): By definition.

(2 \Rightarrow 3): By Lemma 2.18 we have an exact sequence

$$\mathcal{M}_{n-1} \xrightarrow{\bar{\hbar}} \mathcal{M}_n \xrightarrow{\rho_{0,n}} \mathcal{M}_0 \rightarrow 0.$$

Since $\mathcal{M}_0 \in \mathcal{S}_0$, we can proceed by induction to conclude that $\mathcal{M}_n \in \mathcal{S}_n$ for every $n \geq 0$.

(3 \Rightarrow 1): The statement being of local nature, we may assume the existence of $N \geq 0$ such that $\mathcal{M}_{\hbar\text{-tor}N} \simeq \mathcal{M}_{\hbar\text{-tor}}$.

Assume that \mathcal{M}_n belongs to \mathcal{S} for any $n \geq 0$ and let us prove that ${}_n\mathcal{M}$ belongs to \mathcal{S} .

Note that ${}_n\mathcal{M} \simeq_n \mathcal{M}_{\hbar\text{-tor}}$ and that, by Corollary 2.17, for each $n \geq 0$, $\mathcal{M}_{\hbar\text{-tor}n} \in \mathcal{S}$. Taking N big enough as above implies that $\mathcal{M}_{\hbar\text{-tor}}$ belongs to \mathcal{S} , so by Proposition 3.3, $\mathcal{M}_{\hbar\text{-tor}} \in \text{Mod}_{\mathcal{S}}(\mathcal{A})$. Therefore ${}_n\mathcal{M} \in \mathcal{S}$. \square

PROPOSITION 3.5. *$\text{Mod}_{\mathcal{S}}(\mathcal{A})$ is a Serre subcategory of $\text{Mod}_{\text{coh}}(\mathcal{A})$.*

Proof. Consider an exact sequence in $\text{Mod}_{\text{coh}}(\mathcal{A})$

$$0 \rightarrow \mathcal{M}_1 \xrightarrow{f} \mathcal{M}_2 \xrightarrow{g} \mathcal{M}_3 \rightarrow 0.$$

One has a distinguished triangle

$$gr_{\hbar}^n(\mathcal{M}_1) \rightarrow gr_{\hbar}^n(\mathcal{M}_2) \rightarrow gr_{\hbar}^n(\mathcal{M}_3) \xrightarrow{+1},$$

so $gr_{\hbar}^n(\mathcal{M}_i) \in D_{\mathcal{S}}^b(\mathcal{A})$ if it is so for $gr_{\hbar}^n(\mathcal{M}_j)$ and $gr_{\hbar}^n(\mathcal{M}_k)$, with $i \neq j, k$, for every $n \in \mathbb{N}_0$.

Therefore, it remains to prove that if \mathcal{M}_2 is an object of $\text{Mod}_{\mathcal{S}}(\mathcal{A})$ then \mathcal{M}_1 and \mathcal{M}_3 belong to $\text{Mod}_{\mathcal{S}}(\mathcal{A})$. To prove this we consider the long exact sequence

$$0 \rightarrow_n \mathcal{M}_1 \rightarrow_n \mathcal{M}_2 \rightarrow_n \mathcal{M}_3 \rightarrow \mathcal{M}_{1,n} \rightarrow \mathcal{M}_{2,n} \rightarrow \mathcal{M}_{3,n} \rightarrow 0.$$

The assumption on \mathcal{S} entails that ${}_n\mathcal{M}_1, \mathcal{M}_{3,n} \in \mathcal{S}_n$. By Proposition 3.4, we also have ${}_n\mathcal{M}_3 \in \mathcal{S}_n$ and the proof follows. \square

Hence, in view of (3), an \mathcal{A} -module \mathcal{M} is an object of $\text{Mod}_{\mathcal{S}}(\mathcal{A})$ if and only if $\mathcal{M}_{\hbar\text{-tor}}$ and $\mathcal{M}_{\hbar\text{-tf}}$ are objects of $\text{Mod}_{\mathcal{S}}(\mathcal{A})$.

4. Extension of functors. Let now X, \mathcal{A} and \mathcal{S} be as in Section 3. In the sequel we shall assume that \mathcal{S} satisfies the following.

Assumption 4.1. For each open subset $U \subset X$, $\mathcal{S}(U) = \bigcup_n \mathcal{S}_n(U)$.

Let Y denote another complex analytic manifold and \mathcal{A}' an algebra of formal deformation on Y . For simplicity we still denote by \hbar the fixed section in the centre of \mathcal{A}' , thus both \mathcal{A} and \mathcal{A}' are $\mathbb{K}[[\hbar]]$ -algebras. Let us denote by \mathcal{B}' the corresponding basis of neighbourhoods in Y . For a substack \mathcal{S}' of $\text{Mod}(\mathcal{A}')$, for each $n \in \mathbb{N}_0$, according to the notations of Section 3, we shall denote by \mathcal{S}'_n the substack:

$$\mathcal{S}'_n : V \mapsto \mathcal{S}'_n(V) = \mathcal{S}'(V) \cap \text{Mod}(\mathcal{A}'_n|_V).$$

From now on we consider fixed a full abelian substack \mathcal{C}' of $\text{Mod}(\mathcal{A}')$ as well as a full Serre substack \mathcal{S}' of \mathcal{C}' .

Firstly assume that we are given a $\mathbb{K}[[\hbar]]$ -linear functor $F : \text{Mod}(\mathcal{A}) \rightarrow \text{Mod}(\mathcal{A}')$. Then, naturally, one defines a new functor F^{\hbar} , formal extension of F , by setting the following.

DEFINITION 4.2. F^{\hbar} is the functor from $\text{Mod}(\mathcal{A})$ to $\text{Mod}(\mathcal{A}')$:

(1) for $\mathcal{M} \in \text{Mod}(\mathcal{A})$,

$$F^{\hbar}(\mathcal{M}) = \varprojlim_{n \geq 0} F(\mathcal{M}_n),$$

(2) given a morphism $f : \mathcal{M} \rightarrow \mathcal{N}$ in $\text{Mod}(\mathcal{A})$,

$$F^{\hbar}(f) : F^{\hbar}(\mathcal{M}) \rightarrow F^{\hbar}(\mathcal{N})$$

is the morphism associated to the morphisms

$$F(\mathcal{M}_n) \xrightarrow{F(f_n)} F(\mathcal{N}_n),$$

where $\mathcal{M}_n \xrightarrow{f_n} \mathcal{N}_n$ is induced by f .

Our goal now is to discuss the properties of F^{\hbar} when F is a functor from \mathcal{S} to \mathcal{S}' (in a sense to be clarified) and regarding its restriction to $\text{Mod}_{\mathcal{S}}(\mathcal{A})$. For that we need to state additional assumptions.

Assumption 4.3. Henceforward we assume that \mathcal{S}' plays the role of \mathcal{S} in Condition 2.20 with respect to \mathcal{C}' and \mathcal{B}' .

Assumption 4.4. We fix a functor ϕ from the category $\text{Op}(X)$ of open subsets of X to the category $\text{Op}(Y)$ satisfying the following conditions:

- $\Phi(X) = Y$;
- For any open subset $\Omega \subset X$ and any open covering $(U_i)_i$ of Ω , $(\Phi(U_i))_i$ is an open covering of $\Phi(\Omega)$.

Let us denote by Φ^*S' the prestack defined by assigning to each open subset $U \subset X$ the subcategory $\Phi^*S'(U) := S'(\Phi(U))$ of $\text{Mod}(\mathcal{A}'|_{\Phi(U)})$, the restriction morphism associated to $U \supset V$ being the sheaf restriction from $\Phi(U)$ to $\Phi(V)$.

Let now F be a $\mathbb{K}[[\hbar]]$ -linear functor of prestacks: $F : \mathcal{S} \rightarrow \Phi^*S'$. In particular, to each $U \in \text{Op}(X)$, F assigns a $\mathbb{K}[[\hbar]]$ -linear functor $F(U) : \mathcal{S}(U) \rightarrow S'(\Phi(U))$ compatible with the restriction morphisms in $\text{Op}(X)$.

Whenever there is no ambiguity, we shall write F instead of $F(X)$. We shall keep this simplified notation up to the end of this section whenever there is no risk of confusion.

According to the preceding conventions, given $\mathcal{M} \in \mathcal{S}$ if $\hbar^{n+1}\mathcal{M} = 0$, then $\hbar^{n+1}F(\mathcal{M}) = 0$, hence $F|_{\mathcal{S}_n}$ takes values in \mathcal{S}'_n .

Let now $U \in \text{Op}(X)$ and let us consider $\mathcal{M} \in \text{Mod}_{\mathcal{S}(U)}(\mathcal{A}|_U)$.

For $n > k \geq 0$ denote by $F(U)(\rho_{k,n})$ the image of the epimorphism $\rho_{k,n} : \mathcal{M}_n \rightarrow \mathcal{M}_k$ by $F(U)$.

We obtain a projective system of $\mathcal{A}'|_{\Phi(U)}$ -modules $(F(U)(\mathcal{M}_n), F(U)(\rho_{k,n}))$ and, by Definition 4.2, an extended functor $F(U)^{\hbar} : \text{Mod}_{\mathcal{S}(U)}(\mathcal{A}|_U) \rightarrow \text{Mod}(\mathcal{A}'|_{\Phi(U)})$ given by $F(U)^{\hbar}(\mathcal{M}) := \varprojlim_{n \geq 0} F(U)(\mathcal{M}_n)$. Recall also that the functor \varprojlim on the category of projective systems of $\text{Mod}(\mathcal{A}')$ commutes with restriction to open subsets, hence if we start with $\mathcal{M} \in \text{Mod}(\mathcal{A}')$, for each open subset $U \subset X$,

$$F^{\hbar}(\mathcal{M})|_{\Phi(U)} \simeq (F|_U)^{\hbar}(\mathcal{M}|_U).$$

PROPOSITION 4.5. *Let \mathcal{M} be an \hbar -torsion \mathcal{A} -module in $\text{Mod}_{\mathcal{S}}(\mathcal{A})$. Then we have $F^{\hbar}(\mathcal{M}) \simeq F(\mathcal{M})$ in $\text{Mod}(\mathcal{A}')$.*

Proof. In accordance with Proposition 3.3, $\mathcal{M} \in \mathcal{S}$, hence we have a natural morphism $F(\mathcal{M}) \rightarrow F^{\hbar}(\mathcal{M})$. We shall see that this morphism is locally an isomorphism. We can cover X by open subsets $U \subset X$ and consider a family of positive integers N_U such that $\hbar^{N_U+1}\mathcal{M}|_U = 0$. By the assumption, $\{\Phi(U)\}$ is an open covering of Y . Since, for each $n \geq N_U$, $\mathcal{M}_n|_U \simeq \mathcal{M}_{N_U}|_U \simeq \mathcal{M}|_U$, we obtain:

$$F^{\hbar}(\mathcal{M})|_{\Phi(U)} := \varprojlim_{n \geq 0} F(\mathcal{M}_n)|_{\Phi(U)} \simeq F(U)(\mathcal{M}_{N_U}|_U) \simeq F(U)(\mathcal{M}|_U) \simeq F(\mathcal{M})|_{\Phi(U)},$$

which ends the proof. □

As a consequence, by the assumption on \mathcal{S} we conclude:

$$F^{\hbar}|_{\mathcal{S}} \simeq F.$$

REMARK 4.6. The existence of Φ is the main tool to prove Proposition 4.5, which is a key property in the sequel. Φ would also be used if, with our machinery in hand, we went on constructing the stack $\mathcal{M}od_{\mathcal{S}}(\mathcal{A})$ defined by $U \mapsto \text{Mod}_{\mathcal{S}}(\mathcal{A})(U)$, the category $\text{Mod}_{\mathcal{S}}(\mathcal{A})(U)$ being defined in U in a similar way to Definition 3.2. Indeed, we might define F^{\hbar} not only as a morphism of categories but as a functor of prestacks $\mathcal{M}od_{\mathcal{S}}(\mathcal{A}) \rightarrow \Phi^*\mathcal{M}od(\mathcal{A}')$. However, in view of the applications, it is enough to work with F^{\hbar} defined as a morphism of categories (cf. Definition 4.2).

4.1. The case of right exact functors. In the sequel we will assume that $F(X)$ is right exact.

LEMMA 4.7. *Let $\mathcal{M} \in \text{Mod}_S(\mathcal{A})$. For each $y \in Y$, if $K \in \mathcal{B}'$ is contained in a neighbourhood V of y satisfying Condition 2.20 with respect to $F(\mathcal{M}_0)$, then one has $H^j(K; F(\mathcal{M}_n)) = 0$ for any $j > 0$ and $n \in \mathbb{N}_0$.*

Proof. In accordance with the right exactness of $F(X)$, for each $n \in \mathbb{N}$, the sequence:

$$F(h^n \mathcal{M} / h^{n+1} \mathcal{M}) \rightarrow F(\mathcal{M}_n) \xrightarrow{F(\rho_{n-1,n})} F(\mathcal{M}_{n-1}) \rightarrow 0$$

is exact and $F(h^n \mathcal{M} / h^{n+1} \mathcal{M})$ is a quotient of $F(\mathcal{M}_0)$.

The proof then proceeds by induction as in Lemma 2.21(1). \square

Let $\mathcal{M} \in \text{Mod}_S(\mathcal{A})$ and let us now denote by $\varrho_n : F^{\hbar}(\mathcal{M}) \rightarrow F(\mathcal{M}_n)$ the canonical projection.

LEMMA 4.8. *For each $n \geq 1$, the sequence*

$$F^{\hbar}(\mathcal{M}) \xrightarrow{\hbar^{n+1}} F^{\hbar}(\mathcal{M}) \xrightarrow{\varrho_n} F(\mathcal{M}_n) \rightarrow 0. \quad (9)$$

is exact.

Proof. Using Lemma 2.18 and considering sufficiently small Ω in a basis \mathcal{B}' in the conditions of Assumption 2.2 or Assumption 2.3, it follows that, for any $N \geq n$, the sequence

$$\Gamma(\Omega; F(\mathcal{M}_N)) \xrightarrow{F(\hbar^{n+1})} \Gamma(\Omega; F(\mathcal{M}_N)) \xrightarrow{F(\rho_{n,N})} \Gamma(\Omega; F(\mathcal{M}_n)) \rightarrow 0 \quad (10)$$

is exact. In this way we obtain an exact sequence of projective systems satisfying the Mittag-Leffler condition, so applying the functor \varprojlim_N we obtain an exact sequence:

$$\varprojlim_N \Gamma(\Omega; F(\mathcal{M}_N)) \rightarrow \varprojlim_N \Gamma(\Omega; F(\mathcal{M}_N)) \rightarrow \Gamma(\Omega; F(\mathcal{M}_n)) \rightarrow 0. \quad (11)$$

If \mathcal{B}' is the basis of open sets, this immediately entails the exactness of (9). If \mathcal{B}' is the basis of compact sets, we prove the exactness in the stalks.

Let $y \in Y$, and let us consider a fundamental system of open neighbourhoods $\{\Omega_l\}_{l \in \mathbb{N}}$ of y and a fundamental system of compact neighbourhoods $\{K_l\}_{l \in \mathbb{N}}$ of y , with $K_l \in \mathcal{B}'$ and

$$K_{l+1} \subset \Omega_l \subset \text{Int}(K_l). \quad (12)$$

Applying \varinjlim to the sequence obtained by replacing Ω by K_l in (11), we obtain an exact sequence:

$$F^{\hbar}(\mathcal{M})_y \xrightarrow{\hbar^{n+1}} F^{\hbar}(\mathcal{M})_y \xrightarrow{\varrho_n} F(\mathcal{M}_n)_y \rightarrow 0,$$

as desired. \square

As a consequence, we have the following.

COROLLARY 4.9. *Let $\mathcal{M} \in \text{Mod}_S(\mathcal{A})$. Then $F^{\hbar}(\mathcal{M})$ is an \hbar -complete \mathcal{A}' -module.*

As a consequence of Corollary 4.9 together with Lemma 2.21 we conclude:

PROPOSITION 4.10. *Let $\mathcal{M} \in \text{Mod}_S(\mathcal{A})$. Then $F^h(\mathcal{M})$ satisfies the vanishing condition (8) on Condition 2.20 for sufficiently small $K \in \mathcal{B}'$.*

THEOREM 4.11. *The functor F^h is right exact.*

Proof. Let $\mathcal{M}' \rightarrow \mathcal{M} \rightarrow \mathcal{M}'' \rightarrow 0$ be an exact sequence in $\text{Mod}_S(\mathcal{A})$. It gives an exact sequence of projective families with elements in S' :

$$F(\mathcal{M}'_n) \rightarrow F(\mathcal{M}_n) \rightarrow F(\mathcal{M}''_n) \rightarrow 0, \quad \text{for } n \geq 0. \quad (13)$$

Thus, for every sufficiently small set Ω in a basis \mathcal{B}' in the conditions of Assumption 2.2 or Assumption 2.3, we get a projective system of exact sequences,

$$\Gamma(\Omega; F(\mathcal{M}'_n)) \rightarrow \Gamma(\Omega; F(\mathcal{M}_n)) \rightarrow \Gamma(\Omega; F(\mathcal{M}''_n)) \rightarrow 0, \quad (14)$$

where each term satisfies the Mittag-Leffler condition. The proof then proceeds by the same argument as in Lemma 4.8. \square

COROLLARY 4.12. *For $\mathcal{M} \in \text{Mod}_S(\mathcal{A})$ the sequence below is exact:*

$$F^h(\mathcal{M}_{h\text{-tor}}) \rightarrow F^h(\mathcal{M}) \rightarrow F^h(\mathcal{M}_{h\text{-tf}}) \rightarrow 0. \quad (15)$$

PROPOSITION 4.13. *Let us assume that S' is a subcategory of $\text{Mod}_{\text{coh}}(\mathcal{A}')$. Then, for every $\mathcal{M} \in \text{Mod}_S(\mathcal{A})$, $F^h(\mathcal{M})$ belongs to $\text{Mod}_{S'}(\mathcal{A}')$.*

Proof. In view of Proposition 3.4 and Lemma 4.8 it is enough to prove that $F^h(\mathcal{M})$ is \mathcal{A}' -coherent, which in turn is reduced to prove that

$$\hbar^n F^h(\mathcal{M}) / \hbar^{n+1} F^h(\mathcal{M})$$

is a coherent \mathcal{A}'_0 -module by Theorem 2.6 together with Corollary 4.9.

Since $\hbar^n F^h(\mathcal{M}) / \hbar^{n+1} F^h(\mathcal{M}) = \hbar^n F^h(\mathcal{M})_n \simeq \hbar^n F(\mathcal{M}_n)$ the result follows. \square

PROPOSITION 4.14. *Consider the case where each S_n coincides with the stack $\text{Mod}_{\text{coh}}(\mathcal{A}_n)$. Assume, in addition, that $F^h(\mathcal{A})$ is \hbar -torsion free. Then:*

- (1) $F^h(\mathcal{A})$ is *chc*.
- (2) For any $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{A})$, $F^h(\mathcal{M})$ is *chc*.

Proof. Let us start by noting that, by the assumption, $\text{Mod}_S(\mathcal{A})$ coincides with $\text{Mod}_{\text{coh}}(\mathcal{A})$.

(1) The statement follows by Proposition 2.12, together with Propositions 4.10 and 4.9.

(2) Let us consider a local presentation

$$\mathcal{A}^N \rightarrow \mathcal{A}^L \rightarrow \mathcal{M} \rightarrow 0$$

for some $N, L \in \mathbb{N}$. We get an exact sequence

$$F^h(\mathcal{A})^N \rightarrow F^h(\mathcal{A})^L \rightarrow F^h(\mathcal{M}) \rightarrow 0,$$

and the result follows by Lemma 2.8. \square

4.2. The case of exact functors. Throughout this section we shall assume that $F(U)$ is exact for any open subset $U \subset X$.

In this case, applying Lemmas 2.19 and 4.8, we get a family of exact sequences

$$0 \rightarrow F^{\hbar}(\mathcal{M})_0 \xrightarrow{\overline{h^n}} F^{\hbar}(\mathcal{M})_n \xrightarrow{h} F^{\hbar}(\mathcal{M})_n, \forall n.$$

Thus, again by Lemma 2.19, we conclude the following.

COROLLARY 4.15. *Given $\mathcal{M} \in \text{Mod}_{\mathcal{S}}(\mathcal{A})$, if \mathcal{M} is \hbar -torsion free, then so is $F^{\hbar}(\mathcal{M})$.*

THEOREM 4.16. *F^{\hbar} is also an exact functor.*

To prove this we shall need the following results.

LEMMA 4.17. *The sequence of \mathcal{A}' -modules*

$$0 \rightarrow F^{\hbar}(\mathcal{M}_{\hbar\text{-tor}}) \rightarrow F^{\hbar}(\mathcal{M}) \rightarrow F^{\hbar}(\mathcal{M}_{\hbar\text{-}f}) \rightarrow 0 \quad (16)$$

is exact.

Proof. For each $n \geq 0$, applying the exactness of F to (5), we obtain an exact sequence of projective systems with elements in \mathcal{S}' :

$$0 \rightarrow F((\mathcal{M}_{\hbar\text{-tor}})_n) \rightarrow F(\mathcal{M}_n) \rightarrow F((\mathcal{M}_{\hbar\text{-}f})_n) \rightarrow 0. \quad (17)$$

Thus, for every sufficiently small set Ω in a basis \mathcal{B}' in the conditions of Assumption 2.2 or Assumption 2.3, we get a projective system of exact sequences

$$0 \rightarrow \Gamma(\Omega; F((\mathcal{M}_{\hbar\text{-tor}})_n)) \rightarrow \Gamma(\Omega; F(\mathcal{M}_n)) \rightarrow \Gamma(\Omega; F((\mathcal{M}_{\hbar\text{-}f})_n)) \rightarrow 0, \quad (18)$$

and the result follows by a similar argument to that used in the proof of Lemma 4.8. \square

COROLLARY 4.18. *For every $\mathcal{M} \in \text{Mod}_{\mathcal{S}}(\mathcal{A})$ and $n \geq 0$ one has*

$${}_n F^{\hbar}(\mathcal{M}) \simeq F({}_n \mathcal{M}).$$

Proof. Fix $n \geq 0$. By Proposition 4.5, $F^{\hbar}(\mathcal{M}_{\hbar\text{-tor}}) \simeq F(\mathcal{M}_{\hbar\text{-tor}})$ in $\text{Mod}(\mathcal{A}')$.

Then Lemma 4.17 and Corollary 4.15 together with the exactness of F imply the chain of isomorphisms:

$${}_n F^{\hbar}(\mathcal{M}) \simeq {}_n F^{\hbar}(\mathcal{M}_{\hbar\text{-tor}}) \simeq {}_n F(\mathcal{M}_{\hbar\text{-tor}}) \simeq F({}_n \mathcal{M}_{\hbar\text{-tor}}) \simeq F({}_n \mathcal{M}).$$

\square

LEMMA 4.19. *For any $\mathcal{M} \in \text{Mod}_{\mathcal{S}}(\mathcal{A})$, $F^{\hbar}(\mathcal{M})$ is chc.*

Proof. By virtue of Corollaries 4.9 and 4.15 and Propositions 4.10 and 2.12 the assertion holds for \mathcal{M} \hbar -torsion free. To treat the general case, we observe that the statement is of local nature on Y . We can cover Y by open subsets of the form $\Phi(U)$ and consider integers N_U such that $\hbar^{N_U} F^{\hbar}(\mathcal{M}_{\hbar\text{-tor}})|_{\Phi(U)} \simeq \hbar^{N_U} F(\mathcal{M}_{\hbar\text{-tor}}|_U) = 0$. Since $\mathcal{A}'^{\text{loc}} \simeq \hbar^{N_U} \mathcal{A}'^{\text{loc}}$, it follows that in $\Phi(U)$

$$R\mathcal{H}\text{om}_{\mathcal{A}'}(\mathcal{A}'^{\text{loc}}, F^{\hbar}(\mathcal{M}_{\hbar\text{-tor}})) = 0,$$

hence $F^{\hbar}(\mathcal{M}_{\hbar\text{-tor}})$ is *chc* and so is $F^{\hbar}(\mathcal{M})$ by Lemma 4.17. \square

As a consequence of Corollary 4.18 together with Lemma 4.8 we get the following.

COROLLARY 4.20. *For every $\mathcal{M} \in \text{Mod}_{\mathcal{S}}(\mathcal{A})$ and $n \geq 0$, we have a family of isomorphisms in $\text{Mod}(\mathcal{A}'_n)$:*

$$H^j(\text{gr}_{\hbar}^n(F^{\hbar}(\mathcal{M}))) \simeq F(H^j \text{gr}_{\hbar}^n(\mathcal{M})), \forall j \in \mathbb{Z}. \quad (19)$$

End of the proof of Theorem 4.16

Given an exact sequence in $\text{Mod}_{\mathcal{S}}(\mathcal{A})$

$$0 \rightarrow \mathcal{M}' \rightarrow \mathcal{M} \rightarrow \mathcal{M}'' \rightarrow 0 \quad (20)$$

we deduce that

$$0 \rightarrow F^{\hbar}(\mathcal{M}') \rightarrow F^{\hbar}(\mathcal{M}) \rightarrow F^{\hbar}(\mathcal{M}'') \rightarrow 0$$

is exact, thanks to Lemma 4.19 and Corollary 4.20 by applying gr_{\hbar} to (20). This achieves the proof of Theorem 4.16.

4.3. Unicity of extensions. Let us now discuss the unicity of the extensions of the functors treated above.

Consider Serre substacks \mathcal{S} and \mathcal{S}' and a functor $\Phi : \text{Op}(X) \rightarrow \text{Op}(Y)$ as above. Let $G : \mathcal{S} \rightarrow \Phi^* \mathcal{S}'$ be a $\mathbb{K}[[\hbar]]$ -linear functor. Let \mathcal{G} be a functor from $\text{Mod}_{\mathcal{S}}(\mathcal{A})$ to $\text{Mod}(\mathcal{A}')$ such that $\mathcal{G}|_{\mathcal{S}}$ takes values in \mathcal{S}' .

DEFINITION 4.21. We shall say that \mathcal{G} *extends* $G(X)$ if $\mathcal{G}|_{\mathcal{S}}$ and G are isomorphic functors.

In particular, if \mathcal{G} extends $G(X)$, the natural morphisms

$$\mathcal{G}(\mathcal{M}) \rightarrow \mathcal{G}(\mathcal{M}_n) \simeq G(\mathcal{M}_n)$$

define a morphism of functors:

$$\mathcal{G}(\cdot) \rightarrow G^{\hbar}(\cdot).$$

PROPOSITION 4.22. *Consider the case where each \mathcal{S}_n coincides with the stack $\text{Mod}_{\text{coh}}(\mathcal{A}_n)$.*

Assume that $G(X)$ is right exact. Then, up to isomorphism, G^{\hbar} is the unique right exact functor $\mathcal{G} : \text{Mod}_{\text{coh}}(\mathcal{A}) \rightarrow \text{Mod}(\mathcal{A}')$ that extends $G(X)$ and verifies $\mathcal{G}(\mathcal{A}) = \varprojlim_n G(\mathcal{A}_n)$.

Proof. Recall that $\text{Mod}_{\mathcal{S}}(\mathcal{A})$ coincides with $\text{Mod}_{\text{coh}}(\mathcal{A})$. First of all, it is clear that G^{\hbar} satisfies the statement.

Suppose that \mathcal{G} is another right exact functor that extends $G(X)$. Taking a local presentation of $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{A})$, say

$$\mathcal{A}^N \rightarrow \mathcal{A}^L \rightarrow \mathcal{M} \rightarrow 0,$$

and applying \mathcal{G} and G^h , one gets the below diagram with exact rows:

$$\begin{array}{ccccccc} \mathcal{G}(\mathcal{A})^N & \rightarrow & \mathcal{G}(\mathcal{A})^L & \rightarrow & \mathcal{G}(\mathcal{M}) & \rightarrow & 0 \rightarrow 0 \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \downarrow \\ (G^h(\mathcal{A}))^N & \rightarrow & (G^h(\mathcal{A}))^L & \rightarrow & G^h(\mathcal{M}) & \rightarrow & 0 \rightarrow 0. \end{array}$$

The statement then follows by the Five Lemma in view of the hypothesis $\mathcal{G}(\mathcal{A}) = G^h(\mathcal{A})$. \square

PROPOSITION 4.23. *Consider the case where $G(U) : \mathcal{S}(U) \rightarrow \mathcal{S}'(U)$ is an exact functor for any $U \in \text{Op}(X)$. Then up to isomorphism, G^h is the unique (exact) functor \mathcal{G} that extends $G(X)$, takes values in the category of chc objects and verifies ${}_n\mathcal{G}(\mathcal{M}) \simeq \mathcal{G}({}_n\mathcal{M})$ and $\mathcal{G}(\mathcal{M})_n \simeq \mathcal{G}(\mathcal{M}_n)$ (the last isomorphisms being associated to the canonical morphisms).*

Proof. Clearly, G^h satisfies the statement.

On the other hand, consider a right exact functor \mathcal{G} which extends G , goes to the category of chc \mathcal{A}' -modules and commutes with ${}_n(\cdot)$ and $(\cdot)_n$. Then applying gr to the morphism $\mathcal{G} \rightarrow G^h$, one concludes the isomorphism $\mathcal{G} \simeq G^h$. \square

We can now sum up the above discussion and state the main result of this section.

THEOREM 4.24. *Let X and Y be complex manifolds, let \mathcal{A} (resp. \mathcal{A}') be an algebra of formal deformation on X (resp. on Y), let \mathcal{S} (resp. \mathcal{S}') be a full Serre substack of $\mathcal{M}od_{coh}(\mathcal{A})$ (resp. a full Serre substack of a full substack \mathcal{C}' of abelian categories of $\mathcal{M}od(\mathcal{A}')$) and let be given a functor $\Phi : \text{Op}(X) \rightarrow \text{Op}(Y)$ in the conditions of Assumption 4.4. Assume that \mathcal{S} satisfies Assumption 4.1 and that \mathcal{S}' satisfies Assumption 4.3 with respect to \mathcal{C}' . Let $F : \mathcal{S} \rightarrow \Phi^*\mathcal{S}'$ be a $\mathbb{K}[[h]]$ -linear functor and assume that for each open subset U , $F(U)$ is right exact. Then:*

- (1) $F^h : \text{Mod}_{\mathcal{S}}(\mathcal{A}) \rightarrow \text{Mod}(\mathcal{A}')$ is a canonical right exact $\mathbb{K}[[h]]$ -linear extension of F .
- (2) When $\mathcal{C}' = \mathcal{M}od_{coh}(\mathcal{A}')$, then F^h takes values in $\text{Mod}_{\mathcal{S}'}(\mathcal{A}')$.
- (3) If for each open subset $U \subset X$, $F(U)$ is exact, then so is F^h , and up to isomorphism, it is the unique extension of F that takes values in the category of chc objects and commutes with ${}_n(\cdot)$ and $(\cdot)_n$.

REMARK 4.25. F^h is canonical in the following sense: Keeping the preceding notations, if we are given a functor $H : \mathcal{S} \rightarrow \tilde{\mathcal{S}}$, a functor $\tilde{H} : \mathcal{S}' \rightarrow \tilde{\mathcal{S}}'$, and a morphism θ of functors $\Phi, \Psi : \text{Op}(X) \rightarrow \text{Op}(Y)$, we derive a functor of prestacks $\tilde{H}^* : \Phi^*\mathcal{S}' \rightarrow \Psi^*\tilde{\mathcal{S}}'$, together with an extension $H^h : \text{Mod}_{\mathcal{S}}(\mathcal{A}) \rightarrow \text{Mod}_{\tilde{\mathcal{S}}}(\mathcal{A}')$. If moreover $F : \mathcal{S} \rightarrow \Phi^*\mathcal{S}'$, $\tilde{F} : \tilde{\mathcal{S}} \rightarrow \Psi^*\tilde{\mathcal{S}}'$ are given, one may define a morphism $F \rightarrow \tilde{F}$ as being a morphism of functors $\tilde{H}^* \circ F \rightarrow \tilde{F} \circ H$ (cf. diagram below):

$$\begin{array}{ccc} \mathcal{S} & \xrightarrow{F} & \Phi^*\mathcal{S}' \\ H \downarrow & & \downarrow \tilde{H}^* \\ \tilde{\mathcal{S}} & \xrightarrow{\tilde{F}} & \Psi^*\tilde{\mathcal{S}}'. \end{array}$$

In this situation, we get a morphism of functors $F^{\hbar} \rightarrow \tilde{F}^{\hbar} \circ H^{\hbar}$ (cf. diagram below):

$$\begin{array}{ccccc} \mathcal{S} & \hookrightarrow & \text{Mod}_{\mathcal{S}}(\mathcal{A}) & \xrightarrow{F^{\hbar}} & \text{Mod}(\mathcal{A}') \\ H \downarrow & & \downarrow H^{\hbar} & & \parallel \\ \tilde{\mathcal{S}} & \hookrightarrow & \text{Mod}_{\tilde{\mathcal{S}}}(\mathcal{A}) & \xrightarrow{\tilde{F}^{\hbar}} & \text{Mod}(\mathcal{A}'). \end{array}$$

5. Application to $\mathcal{D}_X[[\hbar]]$ -modules. Let X be a complex manifold. Let \mathcal{O}_X be the sheaf of holomorphic functions on X and let \mathcal{D}_X be the sheaf over X of linear holomorphic differential operators of finite order.

As the title suggests, in this section we apply the results of Sections 2 and 3 for $\mathcal{A} = \mathcal{D}_X[[\hbar]]$. We shall extend functors defined on full Serre subcategories of $\text{Mod}_{\text{coh}}(\mathcal{D}_X)$ whose objects are characterized by local properties. As we shall see, these full subcategories being the data of full Serre substacks, the functors we are interested in define linear functors to which we apply the results given in Section 3. So we skip the constant reference to substacks, as stated in Convention 3.1, referring to the categories most of the time.

Recall that one denotes $\mathcal{D}_X[[\hbar]]$ by \mathcal{D}_X^{\hbar} as well as $\mathcal{O}_X[[\hbar]]$ by \mathcal{O}_X^{\hbar} . Also recall that \mathcal{D}_X^{\hbar} satisfies (i), (ii) and (iv) of Assumption 2.3 taking for \mathcal{B} the family of Stein compact subsets of X , for \mathcal{A}_0 the \mathbb{C} -algebra \mathcal{D}_X and considering the prestack of good \mathcal{D}_X -modules in the sense of [5].

The formal extension functor is defined by

$$\begin{aligned} (\cdot)^{\hbar} : \text{Mod}(\mathcal{D}_X) &\rightarrow \text{Mod}(\mathcal{D}_X^{\hbar}), \\ \mathcal{M} &\mapsto \mathcal{M}^{\hbar} = \varprojlim_{n \geq 0} (\mathcal{D}_X^{\hbar} / \hbar^{n+1} \mathcal{D}_X^{\hbar} \otimes_{\mathcal{D}_X} \mathcal{M}). \end{aligned}$$

In particular \mathcal{M}^{\hbar} is \hbar -complete for any $\mathcal{M} \in \text{Mod}(\mathcal{D}_X)$.

An exhaustive study of \mathcal{D}_X^{\hbar} -modules has been done in [2], whose notations we maintain here.

REMARK 5.1. \mathcal{D}_X^{\hbar} induces, for each $n \geq 0$, a (left and right) structure of free \mathcal{D}_X -module of finite rank $(n+1)$ on the algebra $\mathcal{D}_{X,n}^{\hbar} := \mathcal{D}_X^{\hbar} / \hbar^{n+1} \mathcal{D}_X^{\hbar}$ which becomes a $(\mathcal{D}_X^{\hbar}, \mathcal{D}_X)$ -bimodule (resp. a $(\mathcal{D}_X, \mathcal{D}_X^{\hbar})$ -bimodule).

Following [8], an object $\mathcal{M} \in D_{\text{coh}}^b(\mathcal{D}_X^{\hbar})$ is said to be holonomic (resp. regular holonomic) if $\text{gr}_{\hbar}(\mathcal{M})$ is an object of $D_{\text{hol}}^b(\mathcal{D}_X)$ (resp. of $D_{\text{hol}}^b(\mathcal{D}_X)$). The full subcategory of $D_{\text{coh}}^b(\mathcal{D}_X^{\hbar})$ of holonomic (resp. regular holonomic) objects is denoted by $D_{\text{hol}}^b(\mathcal{D}_X^{\hbar})$ (resp. $D_{\text{rh}}^b(\mathcal{D}_X^{\hbar})$).

Denote by Ω_X the sheaf of holomorphic forms of maximal degree on X and set $\Omega_X^{\otimes -1} := \mathcal{H}\text{om}_{\mathcal{O}_X}(\Omega_X, \mathcal{O}_X)$ as usual. We shall need the following functors:

$$\begin{aligned} D'_{\mathbb{C}^{\hbar}} : D^b(\mathbb{C}_X^{\hbar}) &\rightarrow D^b(\mathbb{C}_X^{\hbar}), & F &\mapsto R\mathcal{H}\text{om}_{\mathbb{C}_X^{\hbar}}(F, \mathbb{C}_X^{\hbar}), \\ D'_{\mathcal{D}^{\hbar}} : D^b(\mathcal{D}_X^{\hbar}) &\rightarrow D^b(\mathcal{D}_X^{\hbar}), & \mathcal{M} &\mapsto R\mathcal{H}\text{om}_{\mathcal{D}_X^{\hbar}}(\mathcal{M}, \mathcal{D}_X^{\hbar}), \\ \text{Sol}_{\hbar} : D_{\text{coh}}^b(\mathcal{D}_X^{\hbar}) &\rightarrow D^b(\mathbb{C}_X^{\hbar}), & \mathcal{M} &\mapsto R\mathcal{H}\text{om}_{\mathcal{D}_X^{\hbar}}(\mathcal{M}, \mathcal{O}_X^{\hbar}), \\ DR_{\hbar} : D_{\text{coh}}^b(\mathcal{D}_X^{\hbar}) &\rightarrow D^b(\mathbb{C}_X^{\hbar}), & \mathcal{M} &\mapsto R\mathcal{H}\text{om}_{\mathcal{D}_X^{\hbar}}(\mathcal{O}_X^{\hbar}, \mathcal{M}), \\ \mathbb{D}_{\hbar} : D^b(\mathcal{D}_X^{\hbar}) &\rightarrow D^b(\mathcal{D}_X^{\hbar}), & \mathcal{M} &\mapsto R\mathcal{H}\text{om}_{\mathcal{D}_X^{\hbar}}(\mathcal{M}, \mathcal{D}_X^{\hbar} \otimes_{\mathcal{O}_X} \Omega_X^{\otimes -1})[d_X]. \end{aligned}$$

Note that both $D'_{\mathcal{D}^h}$ and \mathbb{D}_h preserve coherence.

When the base ring is fixed and there is no risk of confusion, we shall denote each of the functors $D'_{\mathbb{C}^h}$ and $D'_{\mathcal{D}^h}$ simply by D'_h .

As shown in Theorem 3.15 of [2], the following diagram is commutative:

$$\begin{array}{ccc} D_{hol}^b(\mathcal{D}_X^h) & \xrightarrow{DR_h} & D_{\mathbb{C}-c}^b(\mathbb{C}_X^h) \\ \downarrow Sol_h & \swarrow D'_h & \\ D_{\mathbb{C}-c}^b(\mathbb{C}_X^h) & & \end{array} \quad (21)$$

REMARK 5.2. After [2], and according to our previous notations, the category $\text{Mod}_{coh}(\mathcal{D}_X^h)$ equals the category $\text{Mod}_{\mathcal{S}}(\mathcal{D}_X^h)$, where the full Serre substack \mathcal{S} is

$$U \mapsto \mathcal{S}(U) = \bigcup_n \text{Mod}_{coh}(\mathcal{D}_{X,n}^h)(U).$$

Similarly, the category $\text{Mod}_{rh}(\mathcal{D}_X^h)$ is defined by the Serre substack

$$U \mapsto \mathcal{S}(U) = \bigcup_n \text{Mod}_{rh}(\mathcal{D}_{X,n}^h)(U).$$

5.1. Inverse image. Let $f : Y \rightarrow X$ be a morphism of complex manifolds. One defines a right exact functor $f_{-}^* : \bigcup_n \text{Mod}(\mathcal{D}_{X,n}^h) \rightarrow \bigcup_n \text{Mod}(\mathcal{D}_{Y,n}^h)$ setting

$$f_{-}^*(\mathcal{M}) = \mathcal{O}_Y \otimes_{f^{-1}\mathcal{O}_X} f^{-1}\mathcal{M}.$$

We refer, among others, to [10] for a quite general study of this functor for $n = 0$.

Let \mathcal{C}' be the abelian full subcategory of pseudocoherent \mathcal{D}_Y^h -modules and let $\mathcal{S}' \subset \mathcal{C}'$ be the full subcategory of pseudocoherent \mathcal{D}_Y^h -modules satisfying Assumption 2.20 with respect to the basis \mathcal{B}' of Stein compact subsets of Y .

LEMMA 5.3. *Let \mathcal{S} be equal to $\bigcup_n \text{Mod}_{coh}(\mathcal{D}_{X,n}^h)$. Then for any morphism $f : Y \rightarrow X$ and any $\mathcal{M} \in \mathcal{S}$, $f_{-}^*(\mathcal{M}) \in \mathcal{S}'$.*

Proof. Observe that, for given $n \geq 0$, and $\mathcal{M} \in \mathcal{S}_n$, considering the $f^{-1}(\mathcal{D}_X)$ -module structure on $f^{-1}(\mathcal{M})$ referred to in Remark 5.1, we get

$$f_{-}^*(\mathcal{M}) \simeq \mathcal{D}_{Y \rightarrow X} \otimes_{f^{-1}\mathcal{D}_X} f^{-1}\mathcal{M}.$$

Recall that any coherent \mathcal{D}_Y -module is locally good, and any pseudocoherent \mathcal{D}_Y -submodule of a good \mathcal{D}_Y -module is itself good.

By [10], it is known that the inverse image of a coherent \mathcal{D}_X -module \mathcal{M} is a pseudocoherent \mathcal{D}_Y -module which satisfies the following property:

1. In a suitable neighbourhood of each $y \in Y$, it is an inductive limit of good \mathcal{D}_Y -submodules.

Since inductive limits commute with cohomology on compact sets, it follows that $f_{-}^*(\mathcal{M})$ satisfies (8). Also note that condition (1) is closed for quotients and hence for submodules in the abelian category of pseudocoherent modules. Indeed, given $\tilde{\mathcal{M}}$ a pseudocoherent module satisfying (1) and given a pseudocoherent submodule $\tilde{\mathcal{N}}$ of

$\tilde{\mathcal{M}}$, the quotient

$$\tilde{\mathcal{M}}/\tilde{\mathcal{N}}$$

is pseudocoherent. If in an open set Ω we have $\tilde{\mathcal{M}}|_{\Omega} \simeq \varinjlim_{\alpha} \mathcal{M}_{\alpha}$, for given good submodules \mathcal{M}_{α} of $\tilde{\mathcal{M}}$, since their images in $\tilde{\mathcal{M}}/\tilde{\mathcal{N}}$ are locally finitely generated, hence coherent, hence good, it follows that each $\tilde{\mathcal{N}} \cap \mathcal{M}_{\alpha}$ is good. By the exactness of inductive limits we get that $\tilde{\mathcal{N}}|_{\Omega} \simeq \varinjlim_{\alpha} \tilde{\mathcal{N}} \cap \mathcal{M}_{\alpha}$. This ends the proof. \square

In what follows, we shall denote by \mathcal{S} the full Serre substack

$$U \mapsto \mathcal{S}(U) = \bigcup_n \mathcal{M}od_{coh}(\mathcal{D}_{X,n})(U)$$

of $\mathcal{M}od_{coh}(\mathcal{D}_X^h)$.

Let us denote by $\Phi : \mathcal{O}p(X) \rightarrow \mathcal{O}p(Y)$ the functor given by $\Phi(U) = f^{-1}(U)$ together with the inclusions $U \supset V \mapsto \Phi(U) \supset \Phi(V)$. Clearly, Φ satisfies Assumption 4.4.

In view of Remark 5.2 and Convention 3.1, by Theorem 4.24 we are in the conditions to define a right exact functor extending f_{-}^{*} :

$$f_{-}^{*,h} : \text{Mod}_{coh}(\mathcal{D}_X^h) \rightarrow \text{Mod}(\mathcal{D}_Y^h),$$

given by

$$f_{-}^{*,h}(\mathcal{M}) = \varprojlim_{n \geq 0} \left(\mathcal{O}_Y \otimes_{f^{-1}(\mathcal{O}_X)} f^{-1} \mathcal{M}_n \right),$$

and we have:

$$f_{-}^{*,h}(\mathcal{O}_X^h) \simeq \mathcal{O}_Y^h. \quad (22)$$

Indeed, one has

$$\begin{aligned} f_{-}^{*,h}(\mathcal{O}_X^h) &= \varprojlim_{n \geq 0} \left(\mathcal{O}_Y \otimes_{f^{-1}(\mathcal{O}_X)} f^{-1}(\mathcal{O}_X^h / \hbar^{n+1} \mathcal{O}_X^h) \right) \\ &\simeq \varprojlim_{n \geq 0} \left(\mathcal{O}_Y \otimes_{f^{-1}(\mathcal{O}_X)} f^{-1}(\mathcal{O}_X \otimes_{\mathbb{C}_X} (\mathbb{C}_X^h / \hbar^{n+1} \mathbb{C}_X^h)) \right) \\ &\simeq \varprojlim_{n \geq 0} \left(\mathcal{O}_Y \otimes_{\mathbb{C}_Y} (\mathbb{C}_Y^h / \hbar^{n+1} \mathbb{C}_Y^h) \right) \simeq \mathcal{O}_Y^h. \end{aligned}$$

Let us consider the $(\mathcal{D}_Y^h, f^{-1}(\mathcal{D}_X^h))$ -bimodule

$$\mathcal{K} := f_{-}^{*,h}(\mathcal{D}_X^h) = \varprojlim_{n \geq 0} \left(\mathcal{O}_Y \otimes_{f^{-1}(\mathcal{O}_X)} f^{-1}(\mathcal{D}_X^h / \hbar^{n+1} \mathcal{D}_X^h) \right).$$

Since for each n , $f^{-1}(\mathcal{D}_X^h / \hbar^{n+1} \mathcal{D}_X^h)$ is isomorphic to $f^{-1}(\mathcal{D}_X) \otimes_{\mathbb{C}_Y} \mathbb{C}_Y^h / \hbar^{n+1} \mathbb{C}_Y^h$ we conclude the following.

LEMMA 5.4. *As a $(\mathcal{D}_Y^{\hbar}, f^{-1}(\mathcal{D}_X^{\hbar}))$ -bimodule \mathcal{K} is isomorphic to the formal extension $(\mathcal{D}_{Y \rightarrow X})^{\hbar}$ of the transfer module $\mathcal{D}_{Y \rightarrow X}$. In particular it is \hbar -complete.*

PROPOSITION 5.5. *Let $f : Y \rightarrow X$ be a morphism. Then:*

1. \mathcal{K} is *chc*.
2. For each $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{D}_X^{\hbar})$, $f_{-}^{*, \hbar}(\mathcal{M})$ is *chc*.
3. For $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{D}_X^{\hbar})$, one has an isomorphism in $\text{Mod}(\mathcal{D}_Y^{\hbar})$:

$$\mathcal{K} \otimes_{f^{-1}(\mathcal{D}_X^{\hbar})} f^{-1} \mathcal{M} \simeq f_{-}^{*, \hbar}(\mathcal{M}). \quad (23)$$

4. For each $\mathcal{M} \in D_{\text{coh}}^b(\mathcal{D}_X^{\hbar})$, $\mathcal{K} \otimes_{f^{-1}(\mathcal{D}_X^{\hbar})}^L f^{-1} \mathcal{M}$ is *chc*.

Proof. (1) Follows by Proposition 4.14(1) since $\mathcal{K} \simeq \mathcal{D}_{Y \rightarrow X}^{\hbar}$ is \hbar -torsion free.

(2) Follows by Proposition 4.14(2).

To prove (3), note that $\mathcal{M} \mapsto \mathcal{K} \otimes_{f^{-1}(\mathcal{D}_X^{\hbar})} f^{-1}(\mathcal{M})$ is a right exact functor that extends f_{-}^{*} in the sense of Definition 4.21. Hence, the result follows by Proposition 4.22.

(4) Let us now consider $\mathcal{M} \in D_{\text{coh}}^b(\mathcal{D}_X^{\hbar})$. Given a local free resolution

$$\mathcal{D}_X^{\hbar, \bullet} \xrightarrow{QIS} \mathcal{M},$$

it yields a quasi-isomorphism

$$\mathcal{K} \bullet \xrightarrow{QIS} \mathcal{K} \otimes_{f^{-1}(\mathcal{D}_X^{\hbar})}^L f^{-1} \mathcal{M}$$

in $D^b(\mathcal{D}_Y^{\hbar})$. To conclude the statement, it is enough to apply Lemma 2.8. \square

REMARK 5.6. As a consequence of (3) of Proposition 5.5, we give a meaning to $Lf_{-}^{*, \hbar}$ as follows:

For $\mathcal{M} \in D_{\text{coh}}^b(\mathcal{D}_X^{\hbar})$ we set:

$$Lf_{-}^{*, \hbar}(\mathcal{M}) := \mathcal{K} \otimes_{f^{-1}(\mathcal{D}_X^{\hbar})}^L f^{-1} \mathcal{M}.$$

More precisely, the left-hand side of (23) defines a left derivable right exact functor I_f on $\text{Mod}(\mathcal{D}_X^{\hbar})$, which is equivalent to $f_{-}^{*, \hbar}$ on $\text{Mod}_{\text{coh}}(\mathcal{D}_X^{\hbar})$. Since any $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{D}_X^{\hbar})$ admits locally a free, hence I_f -projective, resolution, we may denote without ambiguity the derived functor $\mathcal{K} \otimes_{f^{-1}(\mathcal{D}_X^{\hbar})}^L f^{-1}(\cdot)$ by $Lf_{-}^{*, \hbar}(\cdot)$.

PROPOSITION 5.7. *Let $\mathcal{M} \in D_{\text{hol}}^b(\mathcal{D}_X^{\hbar})$. Then $Lf_{-}^{*, \hbar}(\mathcal{M}) \in D_{\text{hol}}^b(\mathcal{D}_Y^{\hbar})$. The same statement holds if we replace the assumption of holonomicity by that of regular holonomicity.*

Proof. Since $gr_{\hbar}(Lf_{-}^{*, \hbar}(\mathcal{M})) \simeq \mathcal{D}_{Y \rightarrow X} \otimes_{f^{-1}(\mathcal{D}_X)}^L f^{-1} gr_{\hbar}(\mathcal{M})$ (indeed, as shown in Proposition 1.4.3 of [8], gr_{\hbar} commutes with tensor product and also with f^{-1}), the result

follows from the analogous property for holonomic \mathcal{D} -modules due to Kashiwara ([3]) together with Proposition 2.11. \square

5.2. The non-characteristic inverse image. Recall that, in the sense of [6], f is said to be non-characteristic for $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{D}_X)$ if

$$f_{\pi}^{-1}(\text{Char}(\mathcal{M})) \cap \ker f_d \subset Y \times_X T_X^* X,$$

where $\text{Char}(\mathcal{M})$ denotes the characteristic variety of \mathcal{M} .

Let us now denote by $NC(f)$ the Serre substack of $\mathcal{M}od_{\text{coh}}(\mathcal{D}_X)$, which, to each open subset $U \subset X$, assigns $NC(f)(U)$, the full Serre subcategory whose objects $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{D}_X|_U)$ are such that $f|_{f^{-1}(U)}$ is non-characteristic for \mathcal{M} .

We can restrict f^* to $NC(f)$ as a \mathbb{C}^h -linear functor of stacks. Then for each open subset $U \subset X$, $f_{\pi}^*(U)$ is exact ([6], Proposition 11.2.12), and takes values in $\text{Mod}_{\text{coh}}(\mathcal{D}_Y|_{f^{-1}(U)})$.

Therefore, by Theorem 4.24, the restriction of the extension functor $f_{\pi}^{*,h}$ to $\text{Mod}_{NC(f)}(\mathcal{D}_X^h)$ is an exact functor

$$f_{\pi}^{*,h} : \text{Mod}_{NC(f)}(\mathcal{D}_X^h) \rightarrow \text{Mod}_{\text{coh}}(\mathcal{D}_Y^h).$$

We shall denote by $D_{NC(f)}^b(\mathcal{D}_X^h)$ the subcategory of $D_{\text{coh}}^b(\mathcal{D}_X^h)$ whose objects \mathcal{M} are such that $gr_h(\mathcal{M})$ is non-characteristic for f .

In particular, for any f , $\mathcal{O}_X^h \in \text{Mod}_{NC(f)}(\mathcal{D}_X^h)$.

Recall that for any coherent \mathcal{D}_X -module, one has a well-defined morphism in $D^b(\mathcal{D}_Y)$:

$$f^{-1}(R\mathcal{H}om_{\mathcal{D}_X}(\mathcal{M}, \mathcal{O}_X)) \rightarrow R\mathcal{H}om_{\mathcal{D}_Y}(Lf_{\pi}^*(\mathcal{M}), \mathcal{O}_Y), \quad (24)$$

which is an isomorphism when \mathcal{M} is non-characteristic for f (Cauchy–Kowalewskaia–Kashiwara’s Theorem).

This result may be generalized to the formal setting as follows.

THEOREM 5.8 *Cauchy–Kowalewskaia–Kashiwara.* Assume that \mathcal{M} belongs to $D_{NC(f)}^b(\mathcal{D}_X^h)$. Then one has a natural isomorphism in $D^b(\mathbb{C}_Y^h)$:

$$f^{-1}R\mathcal{H}om_{\mathcal{D}_X^h}(\mathcal{M}, \mathcal{O}_X^h) \simeq R\mathcal{H}om_{\mathcal{D}_Y^h}\left(Lf_{\pi}^{*,h}(\mathcal{M}), \mathcal{O}_Y^h\right). \quad (25)$$

Proof. By Propositions 2.13 and 2.15, we have a natural morphism between chc objects

$$f^{-1}R\mathcal{H}om_{\mathcal{D}_X^h}(\mathcal{M}, \mathcal{O}_X^h) \rightarrow R\mathcal{H}om_{\mathcal{D}_Y^h}\left(\mathcal{K} \bigotimes_{f^{-1}(\mathcal{D}_X^h)}^L f^{-1}(\mathcal{M}), \mathcal{K} \bigotimes_{f^{-1}(\mathcal{D}_X^h)}^L f^{-1}\mathcal{O}_X^h\right)$$

(see Exercise II.24 in [6] for the construction of the morphism).

Besides, by (22) and (23), $\mathcal{K} \bigotimes_{f^{-1}(\mathcal{D}_X^h)}^L f^{-1}(\mathcal{O}_X^h) \simeq \mathcal{O}_Y^h$. The result then follows by

Propositions 5.5 and 2.11. \square

We may also introduce the so-called *extraordinary inverse image* associated to f , which we denote by $L_{\underline{f}}^{!,\hbar}$:

$$L_{\underline{f}}^{!,\hbar} : D_{coh}^b(\mathcal{D}_X^{\hbar}) \rightarrow D^b(\mathcal{D}_Y^{\hbar}), \quad \mathcal{M} \mapsto \mathbb{D}_{\hbar}(L_{\underline{f}}^{*,\hbar}(\mathbb{D}_{\hbar}(\mathcal{M}))).$$

We refer to [12] for that notion in the \mathcal{D} -module case.

By Proposition 5.7 and duality we get the following.

COROLLARY 5.9. *Let $\mathcal{M} \in D_{hol}^b(\mathcal{D}_X^{\hbar})$. Then, $L_{\underline{f}}^{!,\hbar}(\mathcal{M}) \in D_{hol}^b(\mathcal{D}_Y^{\hbar})$.*

5.3. Direct image. In this section we discuss the possible application or adaptation of our results to the functor of direct image. We shall work with right \mathcal{D}^{\hbar} -modules but all the results are easily adapted to the case of left \mathcal{D}^{\hbar} -modules.

We identify the abelian category of right \mathcal{D}^{\hbar} -modules with the category $\text{Mod}(\mathcal{D}_Y^{\hbar,op})$.

Let $f : Y \rightarrow X$ be a morphism of complex manifolds. Let \mathcal{K} denote the associated transfer module.

5.3.1. The case of a closed embedding. Let us treat the case where $f = i : Y \hookrightarrow X$, the embedding of a closed submanifold. In this case $\mathcal{D}_{Y \rightarrow X}$ is flat over \mathcal{D}_Y and we obtain an exact functor

$$i_* : \text{Mod}_{coh}(\mathcal{D}_Y^{op}) \rightarrow \text{Mod}_{coh}(\mathcal{D}_X^{op}), \quad \mathcal{M} \mapsto i_*(\mathcal{M}) := i_*(\mathcal{M} \otimes_{\mathcal{D}_Y} \mathcal{D}_{Y \rightarrow X}).$$

Here the full Serre substacks \mathcal{S} and \mathcal{S}' are respectively $\text{Mod}_{coh}(\mathcal{D}_Y^{op})$ and $\text{Mod}_{coh}(\mathcal{D}_X^{op})$. We can choose as a candidate for the functor $\Phi : \text{Op}(Y) \rightarrow \text{Op}(X)$ the data $U \mapsto \Phi(U) := X \setminus (Y \setminus U)$ which clearly satisfies Assumption 4.4 and we are in conditions to apply Theorem 4.24 to extend i_* as an exact functor

$$i_*^{\hbar} : \text{Mod}_{coh}(\mathcal{D}_Y^{\hbar,op}) \rightarrow \text{Mod}_{coh}(\mathcal{D}_X^{\hbar,op}),$$

$$i_*^{\hbar}(\mathcal{M}) := \varprojlim_{n \geq 0} i_*(\mathcal{M}_n \otimes_{\mathcal{D}_Y} \mathcal{D}_{Y \rightarrow X}).$$

5.3.2. Discussion of the general case. By Lemma 5.4 we have $\mathcal{K} \simeq (\mathcal{D}_{Y \rightarrow X})^{\hbar}$, hence

$$\mathcal{K}_n \simeq \mathcal{D}_{Y,n}^{\hbar} \otimes_{\mathcal{D}_Y} \mathcal{D}_{Y \rightarrow X}.$$

So for $\mathcal{M} \in \text{Mod}(\mathcal{D}_Y^{\hbar,op})$, we get natural isomorphisms in $\text{Mod}(f^{-1}(\mathcal{D}_X)^{\hbar}_n)$:

$$\mathcal{M}_n \otimes_{\mathcal{D}_Y^{\hbar}} \mathcal{K} \simeq \mathcal{M}_n \otimes_{\mathcal{D}_Y^{\hbar}} \mathcal{K}_n \simeq (\mathcal{M}_n \otimes_{\mathcal{D}_Y^{\hbar}} \mathcal{D}_{Y,n}^{\hbar}) \otimes_{\mathcal{D}_Y} \mathcal{D}_{Y \rightarrow X} \simeq \mathcal{M}_n \otimes_{\mathcal{D}_Y} \mathcal{D}_{Y \rightarrow X}. \quad (26)$$

Since projective limits commute with direct images, (26) entails a morphism

$$f_*(\mathcal{M} \otimes_{\mathcal{D}_Y^{\hbar}} \mathcal{K}) \rightarrow \varprojlim_{n \geq 0} f_*(\mathcal{M}_n \otimes_{\mathcal{D}_Y} \mathcal{D}_{Y \rightarrow X}), \quad (27)$$

which defines a \mathbb{C}^h -linear transformation of functors of stacks. When f is a closed embedding, as proved in Corollary 5.16, it is an isomorphism of functors. Indeed, we do not know if it is an isomorphism in general, as explained in Remark 5.15. However, we have the following partial results.

LEMMA 5.10. *If $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{D}_Y^{h, \text{op}})$ is such that $\mathcal{M} \otimes_{\mathcal{D}_Y^h} \mathcal{K}$ is \hbar -complete, then (27) is an isomorphism.*

Proof. If $\mathcal{M} \otimes_{\mathcal{D}_Y^h} \mathcal{K}$ is \hbar -complete, then

$$\begin{aligned} \mathcal{M} \otimes_{\mathcal{D}_Y^h} \mathcal{K} &\simeq \varprojlim_{n \geq 0} (\mathcal{M} \otimes_{\mathcal{D}_Y^h} \mathcal{K})_n = \varprojlim_{n \geq 0} (\mathbb{C}_{Y,n}^h \otimes_{\mathcal{D}_Y^h} (\mathcal{M} \otimes_{\mathcal{D}_Y^h} \mathcal{K})) \simeq \\ &\simeq \varprojlim_{n \geq 0} (\mathcal{M}_n \otimes_{\mathcal{D}_Y^h} \mathcal{K}) \simeq \varprojlim_{n \geq 0} (\mathcal{M}_n \otimes_{\mathcal{D}_Y} \mathcal{D}_{Y \rightarrow X}), \end{aligned}$$

and since f_* commutes with projective limits the result follows. \square

LEMMA 5.11. *For any $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{D}_Y^{h, \text{op}})$, $\mathcal{M} \otimes_{\mathcal{D}_Y^h} \mathcal{K}$ is *chc*.*

Proof. By Proposition 5.5, \mathcal{K} is *chc*. On the other hand, we can choose a local presentation of \mathcal{M} by locally free \mathcal{D}_Y^h -modules to which we apply the right exact functor $\cdot \otimes_{\mathcal{D}_Y^h} \mathcal{K}$. Hence, $\mathcal{M} \otimes_{\mathcal{D}_Y^h} \mathcal{K}$ is locally the cokernel of a \mathbb{C}_Y^h -linear morphism of *chc*-modules and the result follows by Lemma 2.8. \square

COROLLARY 5.12. *Let $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{D}_Y^{h, \text{op}})$. Then (27) is an isomorphism in each one of the following cases:*

- (i) \mathcal{M} is an \hbar -torsion module.
- (ii) $\mathcal{M} \otimes_{\mathcal{D}_Y^h} \mathcal{K}$ is \hbar -torsion free.

Proof. By Lemma 5.10 it is enough to prove that in both cases $\mathcal{M} \otimes_{\mathcal{D}_Y^h} \mathcal{K}$ is \hbar -complete.

(i) If \mathcal{M} is an \hbar -torsion module and since the result is local, we may assume that there exists some $N > 0$ such that $\hbar^N \mathcal{M} = 0$. This implies that $\hbar^N (\mathcal{M} \otimes_{\mathcal{D}_Y^h} \mathcal{K}) \simeq 0$ and, in particular, $\mathcal{M} \otimes_{\mathcal{D}_Y^h} \mathcal{K}$ is \hbar -complete.

(ii) If $\mathcal{M} \otimes_{\mathcal{D}_Y^h} \mathcal{K}$ is an \hbar -torsion free module, by Lemma 5.11 together with [8], Lemma 1.5.4, it is \hbar -complete. \square

The following result is possibly well known but we find it useful to prove here.

LEMMA 5.13. *Let $F \in \text{Mod}_{\mathbb{R}-c}(\mathbb{C}_X^h)$. Then F is \hbar -complete.*

Proof. We shall prove that the natural morphism $F \rightarrow \varprojlim_{n \geq 0} F_n$ is an isomorphism.

By the triangulation theorem (Proposition 8.2.5 of [6]) we may assume that F is a constructible sheaf on the realization of a finite simplicial complex (S, Δ) (we refer to [6] for the notation) and, for each n , F_n being the cokernel of the morphism $\hbar^{n+1} : F \rightarrow F$, it is also constructible on (S, Δ) . It follows that there exists a locally finite open covering $\{U(\sigma)\}_{\sigma \in \Delta}$ of S such that, for each $\sigma \in \Delta$ and $x \in |\sigma|$, $\Gamma(U(\sigma); F) \simeq F_x$ and $\Gamma(U(\sigma); F_n) \simeq (F_n)_x$ for every $n \in \mathbb{N}$.

As a finitely generated \mathbb{C}^h -module, F_x is \hbar -complete and hence

$$\Gamma(U(\sigma); F) \simeq F_x \simeq \varprojlim_{n \geq 0} (F_x)_n \simeq \varprojlim_{n \geq 0} (F_n)_x \simeq \varprojlim_{n \geq 0} \Gamma(U(\sigma); F_n) \simeq \Gamma(U(\sigma); \varprojlim_{n \geq 0} F_n),$$

and the result follows. \square

COROLLARY 5.14. *If $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{D}_Y^{\hbar, \text{op}})$ is holonomic, then $\mathcal{M} \otimes_{\mathcal{D}_Y^{\hbar}} \mathcal{O}_Y^{\hbar}$ is \hbar -complete. In particular, when $f : Y \rightarrow \{pt\}$, (27) is an isomorphism for every holonomic \mathcal{D}_Y^{\hbar} -module \mathcal{M} .*

Proof. Since in this case $\mathcal{K} \simeq \mathcal{O}_Y^{\hbar}$, then

$$\mathcal{M} \otimes_{\mathcal{D}_Y^{\hbar}} \mathcal{K} \simeq H^0(R\mathcal{H}om_{\mathcal{D}_Y^{\hbar}}(D'_h \mathcal{M}, \mathcal{O}_Y^{\hbar}))$$

is \mathbb{R} -constructible by [2, Theorem 3.13] and the result follows by Lemma 5.13. \square

We then infer that (27) is an isomorphism if Y is a complex line, $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{D}_Y^{\hbar, \text{op}})$ has a discrete support and f is the constant map $f : Y \rightarrow \{pt\}$. Indeed, as proved in [2], the support of \mathcal{M} coincides with the support of \mathcal{M}_0 , so if $\text{supp}(\mathcal{M})$ is discrete, \mathcal{M} is holonomic and the statement follows by Corollary 5.14.

REMARK 5.15. As a matter of fact we did not find a counter-example for the conjecture that if \mathcal{M} is \mathcal{D}_Y^{\hbar} -coherent, then $\mathcal{M} \otimes_{\mathcal{D}_Y^{\hbar}} \mathcal{K}$ is always \hbar -complete. Of course, such a counter-example, to exist, should firstly occur in the smooth case. This difficulty prevented us from applying successfully our results to extend the functor of proper direct image except for a closed embedding as above.

COROLLARY 5.16. *When f is a local immersion, the morphism (27) is an isomorphism for every $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{D}_Y^{\hbar, \text{op}})$.*

Proof. By Theorem 2.10, \mathcal{K} is flat over \mathcal{D}_Y^{\hbar} . Moreover, as can be checked by the reader, $(f^{-1}\mathcal{D}_X)^{\hbar}$ is an algebra of formal deformation.

Since \mathcal{K} is coherent over $(f^{-1}\mathcal{D}_X)^{\hbar}$, $\mathcal{M} \otimes_{\mathcal{D}_Y^{\hbar}} \mathcal{K}$ is coherent over $(f^{-1}\mathcal{D}_X)^{\hbar}$, hence it is \hbar -complete. Since \hbar -completeness is a local property, the result follows. \square

5.3.3. An alternative extension. The idea now is to use the transfer module \mathcal{K} to mimic the \mathcal{D} -module construction of direct images. The $(\mathcal{D}_Y^{\hbar}, f^{-1}(\mathcal{D}_X^{\hbar}))$ -bimodule structure on \mathcal{K} allows us to define functors

$$Rf_{\underline{*}}^{\hbar}, Rf_{\underline{!}}^{\hbar} : D^b(\mathcal{D}_Y^{\hbar, \text{op}}) \rightarrow D^b(\mathcal{D}_X^{\hbar, \text{op}})$$

of direct image and proper direct image respectively by

$$\begin{aligned} Rf_{\underline{*}}^{\hbar}(\mathcal{M}) &:= Rf_*(\mathcal{M} \otimes_{\mathcal{D}_Y^{\hbar}}^L \mathcal{K}), \\ Rf_{\underline{!}}^{\hbar}(\mathcal{M}) &:= Rf_!(\mathcal{M} \otimes_{\mathcal{D}_Y^{\hbar}}^L \mathcal{K}). \end{aligned}$$

We remark that Corollary 5.16 implies that these definitions coincide with $i_{\underline{*}}^{\hbar}$ for a closed embedding i .

LEMMA 5.17. *Let $\mathcal{M} \in D_{\text{coh}}^b(\mathcal{D}_Y^{\hbar, \text{op}})$. Then $Rf_{\underline{*}}^{\hbar}(\mathcal{M})$ is chc.*

Proof. Recall that \mathcal{K} is *chc* by Proposition 5.5. Consider the canonical isomorphisms in $D^b(\mathbb{C}_X^h)$:

$$\mathcal{M} \otimes_{\mathcal{D}_Y^h}^L \mathcal{K} \simeq R\mathrm{Hom}_{\mathcal{D}_Y^h}(D'_h \mathcal{M}, \mathcal{D}_Y^h) \otimes_{\mathcal{D}_Y^h}^L \mathcal{K} \simeq R\mathrm{Hom}_{\mathcal{D}_Y^h}(D'_h \mathcal{M}, \mathcal{K}).$$

Hence, $\mathcal{M} \otimes_{\mathcal{D}_Y^h}^L \mathcal{K}$ is also *chc*. Finally, we conclude that $Rf_{-*}^h(\mathcal{M})$ is *chc* by Proposition 2.14. \square

We are now able to extend to \mathcal{D}^h -modules the classical coherence criterion of direct images of \mathcal{D} -modules.

THEOREM 5.18. *Suppose that $\mathcal{M} \in D_{\mathrm{good}}^b(\mathcal{D}_Y^{h, \mathrm{op}})$ (resp. $\mathcal{M} \in D_{\mathrm{hol}}^b(\mathcal{D}_Y^{h, \mathrm{op}})$) and that f is proper on $\mathrm{supp}(\mathcal{M})$. Then,*

$$Rf_{-*}^h(\mathcal{M}) \in D_{\mathrm{good}}^b(\mathcal{D}_X^{h, \mathrm{op}})$$

(resp. $Rf_{-*}^h(\mathcal{M}) \in D_{\mathrm{hol}}^b(\mathcal{D}_X^{h, \mathrm{op}})$).

Proof. Since by assumption $gr_h(Rf_{-*}^h(\mathcal{M}))$ is an object of $D_{\mathrm{good}}^b(\mathcal{D}_X^{h, \mathrm{op}})$ (resp. $D_{\mathrm{hol}}^b(\mathcal{D}_X^{h, \mathrm{op}})$), the conclusion follows by applying Theorem 2.9 to the object $Rf_{-*}^h(\mathcal{M}) \in D^b(\mathcal{D}_X^{h, \mathrm{op}})$. \square

5.4. Review on specialization, vanishing cycles and nearby-cycles.

5.4.1. Review on Sato's specialization, vanishing and nearby-cycles. We refer to Chapters IV and VIII of [6] for a detailed study of the constructions below.

Let X be a complex analytic manifold, and Y be a submanifold of codimension d . Recall that \mathbb{K} denotes a unital commutative Noetherian ring with finite global dimension. Denote by \tilde{X}_Y the normal deformation of Y in X . This is a real analytic manifold endowed with two canonical maps $p: \tilde{X}_Y \rightarrow X$ and $t: \tilde{X}_Y \rightarrow \mathbb{R}$ such that $T_Y X$ is identified to the real analytic hypersurface of \tilde{X}_Y given by the equation $t = 0$.

Denote by $s: T_Y X \hookrightarrow \tilde{X}_Y$ the canonical embedding. Set $\Omega = t^{-1}(\mathbb{R}^+) \xrightarrow{j} \tilde{X}_Y$ and denote by \tilde{p} the restriction of p to Ω .

Recall that the Sato's specialization functor on $D^b(\mathbb{K}_X)$ is given by $F \mapsto v_Y^{\mathbb{K}}(F) := s^{-1} \mathbb{R}j_* \tilde{p}^{-1} F$. Recall that $v_Y^{\mathbb{K}}$ induces a functor: $D_{\mathbb{C}-c}^b(\mathbb{K}_X) \rightarrow D_{\mathbb{C}-c}^b(\mathbb{K}_{T_Y X})$.

Let us now assume that Y is a complex closed smooth hypersurface of X given as the zero locus of a holomorphic function $f: X \rightarrow \mathbb{C}$.

Let $\tilde{\mathbb{C}}^*$ be the universal covering of $\mathbb{C}^* = \mathbb{C} \setminus \{0\}$, and let $p: \tilde{\mathbb{C}}^* \rightarrow \mathbb{C}^*$ be the projection. Denote by \tilde{X}^* the fibred product $X \times_{\mathbb{C}} \tilde{\mathbb{C}}^*$ and let \tilde{p} be the projection associated to $\mathrm{id} \times_{\mathbb{C}} p$:

$$\begin{array}{ccccc} \tilde{X}^* & \longrightarrow & \tilde{\mathbb{C}}^* & & \\ \downarrow \tilde{p} & & \downarrow p & & \\ Y \xrightarrow{i} X & \xrightarrow{f} & \mathbb{C} & & \end{array}$$

Recall that the nearby-cycle functor $\psi_Y^{\mathbb{K}} : D^b(\mathbb{K}_X) \rightarrow D^b(\mathbb{K}_Y)$ is defined by

$$\psi_Y^{\mathbb{K}}(F) := i^{-1} R\tilde{p}_* \tilde{p}^{-1}(F),$$

and that the vanishing-cycle functor $\phi_Y^{\mathbb{K}} : D^b(\mathbb{K}_X) \rightarrow D^b(\mathbb{K}_Y)$ assigns to an object $F \in D^b(\mathbb{K}_X)$ the mapping cone of $i^{-1}F \rightarrow \psi_Y^{\mathbb{K}}(F)$. The natural morphism $\psi_Y^{\mathbb{K}}(F) \rightarrow \phi_Y^{\mathbb{K}}(F)$ is called the canonical morphism and denoted by can . Both $\psi_Y^{\mathbb{K}}(F)$ and $\phi_Y^{\mathbb{K}}(F)$ induce functors $D_{\mathbb{C}-c}^b(\mathbb{K}_X) \rightarrow D_{\mathbb{C}-c}^b(\mathbb{K}_Y)$.

LEMMA 5.19.

- (a) If $g : X \rightarrow Z$ is a morphism of complex manifolds and $F \in D^b(\mathbb{C}_X^h)$, then in $D^b(\mathbb{C}_Z)$, $\mathbb{R}g_*^{\mathbb{C}^h} F \simeq \mathbb{R}g_*^{\mathbb{C}} F$ and $\mathbb{R}g_!^{\mathbb{C}^h} F \simeq \mathbb{R}g_!^{\mathbb{C}} F$.
- (b) For every $F \in D^b(\mathbb{C}_X^h)$, we have $v_Y^{\mathbb{C}^h}(F) \simeq v_Y^{\mathbb{C}}(F)$, and if Y is a smooth hypersurface of X , we also have $\psi_Y^{\mathbb{C}^h}(F) \simeq \psi_Y^{\mathbb{C}}(F)$.

Proof. Let I^\bullet be a flabby resolution of F in $D^b(\mathbb{C}_X^h)$. Then each I^j is also flabby in $\text{Mod}(\mathbb{C}_X)$. Hence, both $\mathbb{R}g_*^{\mathbb{C}^h} F$ and $\mathbb{R}g_*^{\mathbb{C}} F$ are quasi-isomorphic to $g_*(I^\bullet)$. Similarly, using a c-soft resolution of F instead, we get $\mathbb{R}g_!^{\mathbb{C}^h} F \simeq \mathbb{R}g_!^{\mathbb{C}} F$, which proves (a). (b) follows as a consequence of (a). \square

Henceforth we keep the notations v_Y , ψ_Y , ϕ_Y for the specialization or the nearby-cycle/vanishing-cycle functors on sheaves of \mathbb{C}^h -modules.

REMARK 5.20. Given $F \in D^b(\mathbb{C}_X^h)$, since gr_h commutes with inverse and direct (proper direct) image, we conclude that $gr_h(v_Y(F)) \simeq v_Y(gr_h(F))$, $gr_h(\phi_Y(F)) \simeq \phi_Y(gr_h(F))$ and $gr_h(\psi_Y(F)) \simeq \psi_Y(gr_h(F))$.

5.4.2. Review on specialization, vanishing and nearby-cycle functors for \mathcal{D} -modules.

We start by recalling the (exact) functor of specialization of \mathcal{D}_X -modules (along a submanifold) as developed in [4]. For the basic material besides [4], we refer to [9], [11] and [13].

Let $Y \subset X$ be a submanifold of X and denote by I the defining ideal of Y and by $\pi : T_Y X \rightarrow Y$ the projection of the normal bundle to Y . One denotes by $V_Y^\bullet(\mathcal{D}_X)$ (or by V^\bullet for short once Y is fixed) the Kashiwara–Malgrange V -filtration of \mathcal{D}_X with respect to Y :

$$V^k(\mathcal{D}_X) = \{P \in \mathcal{D}_X : P(I^j) \subset I^{j+k}, \forall j, k \in \mathbb{Z}, j+k \geq 0\}.$$

The graduate ring $gr_V(\mathcal{D}_X)$ is isomorphic to $\pi_* \mathcal{D}_{[T_Y X]}$, where $\mathcal{D}_{[T_Y X]}$ denotes the sheaf of homogeneous differential operators over $T_Y X$.

A coherent \mathcal{D}_X -module \mathcal{M} always admits locally a good V -filtration.

Denote by θ the Euler field on $T_Y X$.

Recall that a coherent \mathcal{D}_X -module \mathcal{M} is specializable along Y if for every local good V -filtration $V^\bullet(\mathcal{M})$ on \mathcal{M} there is locally a non-zero polynomial $b \in \mathbb{C}[s]$ such that

$$b(\theta - k)V^k(\mathcal{M}) \subset V^{k+1}(\mathcal{M}), \quad \forall k \in \mathbb{Z},$$

where b is called the Bernstein–Sato polynomial or a b -function associated to the filtration V^\bullet .

In the sequel, when there is no risk of confusion, we often write *specializable* instead of *specializable along* Y , once the submanifold Y is fixed.

Denote by G a section of the canonical morphism $\mathbb{C} \rightarrow \mathbb{C}/\mathbb{Z}$ and fix on \mathbb{C} the lexicographical order. Let \mathcal{M} be a specializable \mathcal{D}_X -module and denote by $V_G(\mathcal{M})$ a good V -filtration of \mathcal{M} admitting locally b -function whose zeros are contained in G . Such condition defines a global filtration (Kashiwara's canonical V -filtration) on \mathcal{M} , which is uniquely defined.

The specializable of \mathcal{M} along Y is the coherent $\mathcal{D}_{T_Y X}$ -module:

$$\nu_Y(\mathcal{M}) = \mathcal{D}_{T_Y X} \otimes_{\mathcal{D}_{[T_Y X]}} \pi^{-1} gr_{V_G}(\mathcal{M}),$$

and this definition does not depend on the choice of G .

REMARK 5.21. Let us fix G as above. Given an exact sequence of specializable \mathcal{D}_X -modules:

$$0 \rightarrow \mathcal{M}_1 \rightarrow \mathcal{M} \rightarrow \mathcal{M}_2 \rightarrow 0$$

if $b_i(s)$ is the local Bernstein–Sato polynomial for the canonical V -filtration on \mathcal{M}_i , $i = 1, 2$, then $b_1(s) \cdot b_2(s)$ is the Bernstein–Sato polynomial for the canonical V -filtration on \mathcal{M} (see for example [11, Proposition 4.2]).

Denote by $\text{Mod}_{\mathfrak{sp}}(\mathcal{D}_X)$ the full Serre subcategory of $\text{Mod}_{\text{coh}}(\mathcal{D}_X)$ of specializable \mathcal{D}_X -modules along Y . The assignment $U \mapsto \text{Mod}_{\mathfrak{sp}}(\mathcal{D}_X|_U)$ defines a full Serre substack of $\mathcal{M}od_{\text{coh}}(\mathcal{D}_X)$.

The correspondence $\mathcal{M} \mapsto \nu_Y(\mathcal{M})$ determines an exact functor from $\text{Mod}_{\mathfrak{sp}}(\mathcal{D}_X)$ to $\text{Mod}_{\text{coh}}(\mathcal{D}_{T_Y X})$.

Now let us suppose that Y is a complex closed smooth hypersurface of X given by the zero locus of a holomorphic function $f : X \rightarrow \mathbb{C}$. Recall that in this case, we can also associate to a specializable \mathcal{D}_X -module \mathcal{M} the nearby-cycle module

$$\psi_Y(\mathcal{M}) \simeq gr_{V_G}^0(\mathcal{M}) = \frac{V_G^0(\mathcal{M})}{V_G^1(\mathcal{M})},$$

and the vanishing-cycle module

$$\phi_Y(\mathcal{M}) \simeq gr_{V_G}^{-1}(\mathcal{M}) = \frac{V_G^{-1}(\mathcal{M})}{V_G^0(\mathcal{M})}.$$

Thus, $\psi_Y, \phi_Y : \text{Mod}_{\mathfrak{sp}}(\mathcal{D}_X) \rightarrow \text{Mod}_{\text{coh}}(\mathcal{D}_Y)$ are exact functors.

5.5. Specialization, vanishing cycles and nearby-cycles for \mathcal{D}_X^h -modules. Let Y be a submanifold of a complex manifold X . According to the preceding section, we fix a section G of the canonical morphism $\mathbb{C} \rightarrow \mathbb{C}/\mathbb{Z}$ to which all canonical V -filtrations mentioned below will refer.

Given $\mathcal{M} \in \text{Mod}_{\text{coh}}(\mathcal{D}_{X,n}^h)$, we say that \mathcal{M} is specializable along Y and denote it by $\mathcal{M} \in \text{Mod}_{\mathfrak{sp}}(\mathcal{D}_{X,n}^h)$ if it is so when endowed with the structure of \mathcal{D}_X -module as explained in Remark 5.1. We obtain a full Serre substack \mathcal{S} of $\mathcal{M}od_{\text{coh}}(\mathcal{D}_X^h)$ by assigning to each open subset $U \subset X$ the full Serre subcategory $\mathcal{S}(U) = \cup_{n \geq 0} \text{Mod}_{\mathfrak{sp}}(\mathcal{D}_{X,n}^h|_U)$.

DEFINITION 5.22. We say that a coherent \mathcal{D}_X^h -module \mathcal{M} is specializable along Y if $\mathcal{M} \in \text{Mod}_S(\mathcal{D}_X^h)$.

Equivalently, $gr_h(\mathcal{M})$ is specializable in the \mathcal{D}_X -modules sense, that is, both ${}_0\mathcal{M}$ and \mathcal{M}_0 are specializable \mathcal{D}_X -modules along Y .

EXAMPLE 5.23. Every coherent \mathcal{D}_X^h -module \mathcal{M} such that $\text{supp}(\mathcal{M}) \subset Y$ is specializable along Y . Indeed, we have

$$\text{supp}(gr_h(\mathcal{M})) = \text{supp}({}_0\mathcal{M}) \cup \text{supp}(\mathcal{M}_0) \subset \text{supp}(\mathcal{M}) \subset Y.$$

Hence, ${}_0\mathcal{M}$ and \mathcal{M}_0 are specializable along Y .

In the sequel, for short, we shall often say that \mathcal{M} is specializable omitting reference to the submanifold Y .

We denote by $\text{Mod}_{\mathfrak{sp}}(\mathcal{D}_X^h)$ the category $\text{Mod}_S(\mathcal{D}_X^h)$.

As a functor $\Phi : \text{Op}(X) \rightarrow \text{Op}(T_Y X)$ satisfying Assumption 4.4, we consider the data $U \mapsto \Phi(U) = \pi^{-1}(U \cap Y)$, where $\pi : T_Y X \rightarrow Y$ denotes the projection. According to Theorem 4.24, we are in the condition to extend (uniquely up to an isomorphism) the exact functor

$$\nu_Y : \text{Mod}_{\mathfrak{sp}}(\mathcal{D}_X) \rightarrow \text{Mod}_{\text{coh}}(\mathcal{D}_{T_Y X})$$

as an exact functor

$$\begin{aligned} \nu_Y^h : \text{Mod}_{\mathfrak{sp}}(\mathcal{D}_X^h) &\rightarrow \text{Mod}_{\text{coh}}(\mathcal{D}_{T_Y X}^h) \\ \mathcal{M} &\mapsto \nu_Y^h(\mathcal{M}) := \varprojlim_{n \geq 0} \nu_Y(\mathcal{M}_n). \end{aligned}$$

DEFINITION 5.24. Given $\mathcal{M} \in \text{Mod}_{\mathfrak{sp}}(\mathcal{D}_X^h)$, we shall say that $\nu_Y^h(\mathcal{M})$ is the specializable of \mathcal{M} (along Y).

Propositions 3.3 and 4.5 entail the following result.

COROLLARY 5.25. Let \mathcal{M} be an \hbar -torsion \mathcal{D}_X^h -module. Then \mathcal{M} is specializable as a \mathcal{D}_X^h -module if and only if \mathcal{M} is specializable in the \mathcal{D}_X -modules sense. Moreover, if \mathcal{M} is specializable, then $\nu_Y^h(\mathcal{M}) \simeq \nu_Y(\mathcal{M})$ in $\text{Mod}_{\text{coh}}(\mathcal{D}_{T_Y X})$.

By Proposition 3.4 we have the following characterization.

COROLLARY 5.26. Let \mathcal{M} be a coherent \mathcal{D}_X^h -module. Then the following properties are equivalent:

- (1) \mathcal{M} is a specializable \mathcal{D}_X^h -module.
- (2) \mathcal{M}_0 is a specializable \mathcal{D}_X -module.
- (3) \mathcal{M}_n is specializable as a \mathcal{D}_X -module for each $n \geq 0$.

REMARK 5.27. Let \mathcal{M} be a specializable \mathcal{D}_X^h -module. Regarding $gr_h(\mathcal{M})$ as an object of $D^b(\mathcal{D}_X)$, we have a specializable complex in the sense of [9]. Since

$$gr_h \nu_Y^h(\mathcal{M}) \simeq \varprojlim_{n \geq 0} gr_h \nu_Y(\mathcal{M}_n)$$

and, for each n , by construction, $gr_{\hbar} v_Y(\mathcal{M}_n)$ is isomorphic to $v_Y gr_{\hbar}(\mathcal{M}_n)$, we get a morphism

$$gr_{\hbar} v_Y^{\hbar}(\mathcal{M}) \rightarrow v_Y gr_{\hbar}(\mathcal{M}).$$

Theorem 4.24 asserts that this morphism is an isomorphism in $D^b(\mathcal{D}_{T_Y X})$.

REMARK 5.28. Since the ring \mathcal{D}_X^{\hbar} is neither filtered by the order nor by V -filtrations, the notion of Bernstein polynomial for a specializable \mathcal{D}_X^{\hbar} -module does not make sense in general. However, we have the following result.

PROPOSITION 5.29. *Let \mathcal{M} be a specializable \hbar -torsion free \mathcal{D}_X^{\hbar} -module. Assume that $b(s)$ is a Bernstein polynomial for the canonical V -filtration on \mathcal{M}_0 as a specializable \mathcal{D}_X -module. Then, $b_n(s) := (b(s))^{n+1}$ is a Bernstein polynomial of \mathcal{M}_n for the canonical V -filtration.*

Proof. The sequence

$$0 \rightarrow \mathcal{M}_0 \xrightarrow{\bar{\hbar}} \mathcal{M}_1 \xrightarrow{\rho_{0,1}} \mathcal{M}_0 \rightarrow 0,$$

together with Remark 5.21 entails that if $b(s)$ is a Bernstein polynomial for the canonical V -filtration on \mathcal{M}_0 , then $(b(s))^2$ is a Bernstein polynomial for the canonical V -filtration on \mathcal{M}_1 , and we proceed by induction applying the same argument to the sequence

$$0 \rightarrow \mathcal{M}_{n-1} \xrightarrow{\bar{\hbar}} \mathcal{M}_n \xrightarrow{\rho_{0,n}} \mathcal{M}_0 \rightarrow 0.$$

□

In the examples below, we assume $X = \mathbb{C}^m$, for some $m \in \mathbb{N}$, with coordinates (t, x_1, \dots, x_{m-1}) , and $Y = \{(t, x_1, \dots, x_{m-1}) \in \mathbb{C}^m : t = 0\}$.

EXAMPLE 5.30. Let \mathcal{M} be a \mathcal{D}_X^{\hbar} -module with one generator, let us say $\mathcal{M} \simeq \mathcal{D}_X^{\hbar}/\mathcal{J}$ for a coherent ideal \mathcal{J} . Then we have a chain of isomorphisms of \mathcal{D}_X -modules,

$$\mathcal{M}_n \simeq \frac{\mathcal{D}_X^{\hbar}}{\hbar^{n+1}\mathcal{D}_X^{\hbar} + \mathcal{J}} \simeq \frac{\oplus_{i=0,\dots,n} \mathcal{D}_X^{\hbar} \hbar^i}{\tilde{\mathcal{J}}_n},$$

where $\tilde{\mathcal{J}}_n$ is the submodule of $\oplus_{i=0,\dots,n} \mathcal{D}_X^{\hbar} \hbar^i$ given by

$$\tilde{\mathcal{J}}_n = \frac{\mathcal{J}}{\hbar^{n+1}\mathcal{D}_X^{\hbar} \cap \mathcal{J}}.$$

Suppose $\mathcal{M} = \mathcal{D}_X^{\hbar}/\mathcal{D}_X^{\hbar} b(t\partial_t)$, where $b(s)$ is a polynomial in $\mathbb{C}^{\hbar}[s]$, $b(s) = \sum_{i=0}^m a_i(\hbar)s^i$ for some $m \in \mathbb{N}$ and, for $i \geq 0$, $a_i(\hbar) := \sum_{j \geq 0} a_{ij}\hbar^j \in \mathbb{C}^{\hbar}$. Set $b_0(s) = \sum_{i=0}^m a_{i0}s^i$.

Since $\mathcal{M}_0 \simeq \mathcal{D}_X/\mathcal{D}_X b_0(t\partial_t)$, \mathcal{M} is specializable if and only if $b_0(s)$ is a non-zero polynomial in $\mathbb{C}[s]$. We shall calculate particular cases in the following examples.

EXAMPLE 5.31. Let $\mathcal{M} = \mathcal{D}_X^{\hbar}/\mathcal{D}_X^{\hbar}(\hbar t\partial_t + 1)$. Clearly, $\mathcal{M}_0 = 0$, hence $\mathcal{M}_n = 0$ for every n , which entails $v_Y^{\hbar}(\mathcal{M}) = 0$.

EXAMPLE 5.32. Assume that $\mathcal{J} = \mathcal{D}_X^{\hbar}(t\partial_t - \hbar)$. Then

$$\tilde{\mathcal{J}}_n \simeq \{P_0 t\partial_t + \sum_{i=1}^n (P_i t\partial_t - P_{i-1})\hbar^i : P_i \in \mathcal{D}_X\}.$$

Therefore, \mathcal{M}_n can be identified with the cokernel of the \mathcal{D}_X -linear morphism from \mathcal{D}_X^{n+1} to itself given by the right multiplication of the matrix,

$$A_n = \begin{bmatrix} t\partial_t & -1 & 0 & \dots & 0 & 0 \\ 0 & t\partial_t & -1 & \dots & 0 & 0 \\ \dots & \dots & \dots & \dots & \dots & \dots \\ 0 & 0 & 0 & \dots & t\partial_t & -1 \\ 0 & 0 & 0 & \dots & 0 & t\partial_t \end{bmatrix}.$$

Denoting by $u_{1,n}, \dots, u_{n+1,n}$, respectively, the classes of the elements of the canonical basis of \mathcal{D}_X^{n+1} in \mathcal{M}_n , we obtain a system of generators for \mathcal{M}_n satisfying

$$(t\partial_t)u_{1,n} = 0, (t\partial_t)u_{k,n} = u_{k-1,n},$$

for $k = 2, \dots, n+1$. Classically, one derives an isomorphism

$$\mathcal{D}_X/\mathcal{D}_X(t\partial_t)^{n+1} \rightarrow \mathcal{M}_n$$

defined by

$$1 \bmod \mathcal{D}_X(t\partial_t)^{n+1} \mapsto u_{n+1,n}.$$

Therefore, denoting by (x, τ) the associated coordinates in $T_Y X$, we obtain $v_Y(\mathcal{M}_n) \simeq \mathcal{D}_{T_Y X}/\mathcal{D}_{T_Y X}(\tau\partial_\tau)^{n+1}$.

Since $t\partial_t$ acts by multiplication by \hbar in \mathcal{M}_n , the action of \hbar in $v_Y(\mathcal{M}_n)$ coincides with the multiplication by $\tau\partial_\tau$, hence as a $\mathcal{D}_{T_Y X}^\hbar$ -module

$$v_Y(\mathcal{M}_n) \simeq \frac{\mathcal{D}_{T_Y X}^\hbar}{\mathcal{D}_{T_Y X}^\hbar(\tau\partial_\tau - \hbar) + \hbar^{n+1}\mathcal{D}_{T_Y X}^\hbar},$$

and it follows that

$$v_Y^\hbar(\mathcal{M}) = \varprojlim_{n \geq 0} v_Y(\mathcal{M}_n) \simeq \frac{\mathcal{D}_{T_Y X}^\hbar}{\mathcal{D}_{T_Y X}^\hbar(\tau\partial_\tau - \hbar)}.$$

Now assume that Y is a complex closed smooth hypersurface of X given by the zero locus of a holomorphic function $f : X \rightarrow \mathbb{C}$. We can extend the exact functors $\psi_Y, \phi_Y : \text{Mod}_{\text{sp}}(\mathcal{D}_X) \rightarrow \text{Mod}_{\text{coh}}(\mathcal{D}_Y)$, respectively, as functors

$$\begin{aligned} \psi_Y^\hbar : \text{Mod}_{\text{sp}}(\mathcal{D}_X^\hbar) &\rightarrow \text{Mod}_{\text{coh}}(\mathcal{D}_Y^\hbar) \\ \mathcal{M} &\mapsto \psi_Y^\hbar(\mathcal{M}) := \varprojlim_{n \geq 0} \psi_Y(\mathcal{M}_n), \end{aligned}$$

$$\begin{aligned} \phi_Y^\hbar : \text{Mod}_{\text{sp}}(\mathcal{D}_X^\hbar) &\rightarrow \text{Mod}_{\text{coh}}(\mathcal{D}_Y^\hbar) \\ \mathcal{M} &\mapsto \phi_Y^\hbar(\mathcal{M}) := \varprojlim_{n \geq 0} \phi_Y(\mathcal{M}_n). \end{aligned}$$

One can rewrite Propositions 4.5 and 4.10 and Corollaries 4.18 and 4.20 replacing the functor F respectively by ψ_Y and ϕ_Y .

EXAMPLE 5.33. Keeping the notations of above examples, we infer from the results of [13] that, for each $n \geq 0$, $\psi_Y(\mathcal{M}_n)$ is quasi-isomorphic to the complex $v_Y(\mathcal{M}_n) \xrightarrow{\tau-1} v_Y(\mathcal{M}_n)$, that is,

$$\psi_Y(\mathcal{M}_n) \simeq \frac{\mathcal{D}_{T_Y X}}{\mathcal{D}_{T_Y X}(\tau - 1) + \mathcal{D}_{T_Y X}(\tau \partial_\tau)^{n+1}} \simeq \mathcal{D}_Y^{n+1}.$$

Thus,

$$\psi_Y^{\hbar}(\mathcal{M}) \simeq \frac{\mathcal{D}_{T_Y X}^{\hbar}}{\mathcal{D}_{T_Y X}^{\hbar}(\tau - 1) + \mathcal{D}_{T_Y X}^{\hbar}(\tau \partial_\tau - \hbar)},$$

in other words $\psi_Y^{\hbar}(\mathcal{M})$ is quasi-isomorphic to the complex $v_Y^{\hbar}(\mathcal{M}) \xrightarrow{\tau-1} v_Y^{\hbar}(\mathcal{M})$.

5.5.1. The (regular) holonomic case. Consider the Serre subcategory \mathcal{S} of holonomic (respectively regular holonomic) \mathcal{D}_X -modules.

Similar to [2] for the case $n = 0$, we see by Proposition 3.4 that if \mathcal{M} is a holonomic (respectively, regular holonomic) \mathcal{D}_X^{\hbar} -module, then each \mathcal{M}_n is a holonomic (regular holonomic) for the \mathcal{D}_X -module structure of $\mathcal{D}_{X,n}^{\hbar}$ given in Remark 5.1.

Recall that every holonomic \mathcal{D}_X -module is specializable along any submanifold Y , and the specialized module is also a holonomic module. Similarly, we have the following.

COROLLARY 5.34. *Any holonomic \mathcal{D}_X^{\hbar} -module \mathcal{M} is specializable along any submanifold Y . Moreover $v_Y^{\hbar}(\mathcal{M})$ is a holonomic $\mathcal{D}_{T_Y X}^{\hbar}$ -module. If \mathcal{M} is regular holonomic, so is $v_Y^{\hbar}(\mathcal{M})$.*

When Y is a smooth hypersurface if \mathcal{M} is holonomic (resp. regular holonomic), $\psi_Y^{\hbar}(\mathcal{M})$ and $\phi_Y^{\hbar}(\mathcal{M})$ are holonomic (resp. regular holonomic) as \mathcal{D}_Y^{\hbar} -modules.

5.5.2. Comparison theorems. Let us recall that Kashiwara constructed in [4, Theorem 1] for a regular holonomic \mathcal{D}_X -module \mathcal{M} (or, more generally, for an object of $D_{rh}^b(\mathcal{D}_X)$), canonical isomorphisms in $D^b(\mathbb{C}_{T_Y X})$

$$\begin{cases} \text{Sol}_{\mathcal{D}_{T_Y X}}(v_Y(\mathcal{M})) \xrightarrow{\sim} v_Y(\text{Sol}_{\mathcal{D}_X}(\mathcal{M})) \\ \text{DR}_{\mathcal{D}_{T_Y X}}(v_Y(\mathcal{M})) \xleftarrow{\sim} v_Y(\text{DR}_{\mathcal{D}_X}(\mathcal{M})) \end{cases},$$

and, when Y is a smooth hypersurface of X , canonical isomorphisms in $D^b(\mathbb{C}_Y)$

$$\begin{cases} \text{Sol}_{\mathcal{D}_Y}(\psi_Y(\mathcal{M})) \xrightarrow{\sim} \psi_Y(\text{Sol}_{\mathcal{D}_X}(\mathcal{M})) \\ \text{Sol}_{\mathcal{D}_Y}(\phi_Y(\mathcal{M})) \xrightarrow{\sim} \phi_Y(\text{Sol}_{\mathcal{D}_X}(\mathcal{M})) \end{cases}$$

and

$$\begin{cases} \text{DR}_{\mathcal{D}_Y}(\psi_Y(\mathcal{M})) \xleftarrow{\sim} \psi_Y(\text{DR}_{\mathcal{D}_X}(\mathcal{M})) \\ \text{DR}_{\mathcal{D}_Y}(\phi_Y(\mathcal{M})) \xleftarrow{\sim} \phi_Y(\text{DR}_{\mathcal{D}_X}(\mathcal{M})) \end{cases}.$$

More precisely, setting:

$$\begin{aligned}\varphi_1 &= v_Y \circ DR : \text{Mod}_{rh}(\mathcal{D}_X) \rightarrow D^b(\mathbb{C}_{T_Y X}), \\ \varphi_2 &= DR \circ v_Y : \text{Mod}_{rh}(\mathcal{D}_X) \rightarrow D^b(\mathbb{C}_{T_Y X}),\end{aligned}$$

Kashiwara's construction gives a natural transformation $\varphi_1 \xrightarrow{\Psi_K} \varphi_2$. In particular, if the modules are provided with a \mathbb{C}^h action, for any $f \in \mathbb{C}^h$ we get a commutative diagram in $D^b(\mathbb{C}_{T_Y X})$:

$$\begin{array}{ccc} v_Y(DR(\mathcal{M})) & \xrightarrow{f} & v_Y(DR(\mathcal{M})) \\ \downarrow \Psi_K(\mathcal{M}) & & \downarrow \Psi_K(\mathcal{M}) \\ DR(v_Y(\mathcal{M})) & \xrightarrow{f} & DR(v_Y(\mathcal{M})). \end{array}$$

As a consequence, Ψ_K is \mathbb{C}^h -linear.

We shall now generalize these isomorphisms to the \hbar -setting.

Denote by Ω_X^j the sheaf of holomorphic forms of degree j on X . Consider the De Rham complex of X :

$$0 \rightarrow \Omega_X^0 \xrightarrow{d} \Omega_X^1 \rightarrow \cdots \rightarrow \Omega_X^{n-1} \xrightarrow{d} \Omega_X^n \rightarrow 0.$$

Here d denotes the usual exterior derivatives.

For a \mathcal{D}_X^h -module \mathcal{M} we have $DR(\mathcal{M}) \simeq \Omega_X^\bullet \otimes_{\mathcal{O}_X} \mathcal{M}^h$ in $D^b(\mathbb{C}_X^h)$. Indeed, each $\Omega_X^j \otimes_{\mathcal{O}_X} \mathcal{M}$ has a natural structure of \mathbb{C}_X^h -module and the derivatives turn out to be \mathbb{C}_X^h -linear.

By definition $\varprojlim_{k \geq 0} (\Omega_X^\bullet \otimes_{\mathcal{O}_X} \mathcal{M}_k)$ is given by the complex:

$$0 \rightarrow \varprojlim_{k \geq 0} (\Omega_X^0 \otimes_{\mathcal{O}_X} \mathcal{M}_k) \rightarrow \cdots \rightarrow \varprojlim_{k \geq 0} (\Omega_X^n \otimes_{\mathcal{O}_X} \mathcal{M}_k) \rightarrow 0. \quad (28)$$

LEMMA 5.35. *Let \mathcal{M} be a coherent \mathcal{D}_X^h -module. Then $\varprojlim_{k \geq 0} (\Omega_X^\bullet \otimes_{\mathcal{O}_X} \mathcal{M}_k)$ is isomorphic to $\Omega_X^\bullet \otimes_{\mathcal{O}_X} \mathcal{M}$ in $C^b(\mathbb{C}_X^h)$.*

Proof. Recall that \mathcal{M} is \hbar -complete. For each j , the natural morphism

$$\Omega_X^j \otimes_{\mathcal{O}_X} \mathcal{M} \rightarrow \varprojlim_{k \geq 0} (\Omega_X^j \otimes_{\mathcal{O}_X} \mathcal{M}_k)$$

is an isomorphism because Ω_X^j is locally finitely free over \mathcal{O}_X and the projective limit is additive. Clearly, these isomorphisms are compatible with the derivatives, hence (28) is isomorphic to $\Omega_X^\bullet \otimes_{\mathcal{O}_X} \mathcal{M}$. \square

THEOREM 5.36. *For \mathcal{M} , a regular holonomic \mathcal{D}_X^h -module, there are canonical isomorphisms in $D_{\mathbb{C}-c}^b(\mathbb{C}_{T_Y X}^h)$:*

- (i) $DR_{\hbar}(v_Y^h(\mathcal{M})) \xleftarrow{\sim} v_Y(DR_{\hbar}(\mathcal{M})),$
- (ii) $Sol_{\hbar}(v_Y^h(\mathcal{M})) \xrightarrow{\sim} v_Y(Sol_{\hbar}(\mathcal{M})).$

Proof. For each $k \geq 0$, we have a natural morphism in $D^b(\mathbb{C}_{T_Y X}^{\hbar})$:

$$\nu_Y(DR_{\hbar}(\mathcal{M})) \rightarrow \nu_Y(DR_{\hbar}(\mathcal{M}_k)).$$

Since \mathcal{M}_k is an \hbar -torsion regular holonomic \mathcal{D}_X^{\hbar} -module, we have $\nu_Y(DR_{\hbar}(\mathcal{M}_k)) \simeq \nu_Y(DR(\mathcal{M}_k)) \simeq DR_{\hbar}(\nu_Y^{\hbar}(\mathcal{M}_k))$ in $D^b(\mathbb{C}_{T_Y X}^{\hbar})$. In this way we get a canonical morphism in $D^b(\mathbb{C}_{T_Y X}^{\hbar})$:

$$\nu_Y(DR_{\hbar}(\mathcal{M})) \rightarrow DR_{\hbar}(\nu_Y^{\hbar}(\mathcal{M}_k)), \quad (29)$$

which entails morphism:

$$\nu_Y(DR_{\hbar}(\mathcal{M})) \rightarrow \Omega_{T_Y X}^{\bullet} \otimes_{\mathcal{O}_{T_Y X}} \nu_Y^{\hbar}(\mathcal{M}_k).$$

So we obtain a morphism in $C^b(\mathbb{C}_{T_Y X}^{\hbar})$:

$$\nu_Y(DR_{\hbar}(\mathcal{M})) \rightarrow \varprojlim_{k \geq 0} (\Omega_{T_Y X}^{\bullet} \otimes_{\mathcal{O}_{T_Y X}} \nu_Y^{\hbar}(\mathcal{M}_k)).$$

Finally, (i) follows from Lemma 5.35 as the composition of the sequence of morphisms given below:

$$\nu_Y(DR_{\hbar}(\mathcal{M})) \rightarrow \Omega_{T_Y X}^{\bullet} \otimes_{\mathcal{O}_{T_Y X}} \nu_Y^{\hbar}(\mathcal{M}) \xrightarrow{qis} DR_{\hbar}(\nu_Y^{\hbar}(\mathcal{M})).$$

Let us now prove that (i) is an isomorphism. Note that $\nu_Y(DR_{\hbar}(\mathcal{M}))$ and $DR_{\hbar}(\nu_Y^{\hbar}(\mathcal{M}))$ are both objects of $D_{\mathbb{C}-c}^b(\mathbb{C}_{T_Y X}^{\hbar})$, hence they are *chc*. Therefore, it is enough to prove that we obtain an isomorphism when we apply gr_{\hbar} to (i). We have on one hand: $gr_{\hbar}(\nu_Y(DR_{\hbar}(\mathcal{M}))) \simeq \nu_Y(DR(gr_{\hbar}(\mathcal{M})))$. Since $gr_{\hbar}(\mathcal{M}) \in D_{rh}^b(\mathcal{D}_X)$, we have $\nu_Y(DR(gr_{\hbar}(\mathcal{M}))) \simeq DR\nu_Y(gr_{\hbar}(\mathcal{M}))$.

On the other hand: $gr_{\hbar}DR_{\hbar}(\nu_Y^{\hbar}(\mathcal{M})) \simeq DRgr_{\hbar}(\nu_Y^{\hbar}(\mathcal{M})) \simeq DR\nu_Y(gr_{\hbar}(\mathcal{M}))$ by Remark 5.27.

To end the proof, we remark that (ii) follows by the following chain of isomorphisms:

$$\begin{aligned} Sol_{\hbar}(\nu_Y^{\hbar}(\mathcal{M})) &\simeq D'_{\hbar}(DR_{\hbar}(\nu_Y^{\hbar}(\mathcal{M}))) \\ &\xrightarrow{\sim} D'_{\hbar}\nu_Y(DR_{\hbar}(\mathcal{M})) \\ &\simeq \nu_Y(D'_{\hbar}(DR_{\hbar}(\mathcal{M}))) \\ &\simeq \nu_Y(Sol_{\hbar}(\mathcal{M})), \end{aligned}$$

where the first and the fourth isomorphisms follow from (21), the second follows by applying the contravariant functor D' to (i) and the third follows by Proposition 8.4.13 of [6]. \square

Similarly one proves the following.

COROLLARY 5.37. *Let Y be a smooth hypersurface of X and \mathcal{M} a regular holonomic \mathcal{D}_X -module \mathcal{M} . There are canonical isomorphisms in $D_{\mathbb{C}-c}^b(\mathbb{C}_Y^{\hbar})$:*

$$(i) \quad \begin{cases} Sol_{\hbar_Y}(\psi_Y^{\hbar}(\mathcal{M})) \xrightarrow{\sim} \psi_Y(Sol_{\hbar_X}(\mathcal{M})) \\ Sol_{D_{\hbar}}(\phi_Y^{\hbar}(\mathcal{M})) \xrightarrow{\sim} \phi_Y(Sol_{\hbar}(\mathcal{M})) \end{cases},$$

$$(ii) \begin{cases} DR_{\mathcal{D}_h}(\psi_Y^h(\mathcal{M})) \xleftarrow{\sim} \psi_Y(DR_h(\mathcal{M})) \\ DR_h(\phi_Y^h(\mathcal{M})) \xleftarrow{\sim} \phi_Y(DR_h(\mathcal{M})) \end{cases}.$$

5.6. Review on Fourier transforms and micro-localization.

5.6.1. Review of Fourier–Sato transform and micro-localization of sheaves.

Denote by \mathbb{R}^+ the multiplicative group of positive numbers, and suppose a real or complex manifold E endowed with an action of \mathbb{R}^+ is given. One denotes by $\text{Mod}_{\mathbb{R}^+}(\mathbb{K}_E)$ the full subcategory of $\text{Mod}(\mathbb{K}_E)$ consisting of sheaves F such that for any orbit b of \mathbb{R}^+ in E , $F|_b$ is a locally constant sheaf. One also denotes by $D_{\mathbb{R}^+}^+(\mathbb{K}_E)$ the full subcategory of $D^+(\mathbb{K}_E)$ consisting of objects F such that for all $j \in \mathbb{Z}$, $H^j(F) \in \text{Mod}_{\mathbb{R}^+}(\mathbb{K}_E)$. An object of $D_{\mathbb{R}^+}^+(\mathbb{K}_E)$ is called a conic object.

Let now $E \xrightarrow{\pi} Y$ denote a holomorphic vector bundle on a complex analytical manifold Y , and let $E' \xrightarrow{\tilde{\pi}} Y$ denote its dual bundle. We will be particularly concerned with the cases where Y is a submanifold of a manifold X , $E = T_Y X$ is the tangent bundle to Y on X and $E' = T_Y^* X$ is the cotangent bundle to Y on X .

Let F be a sheaf of \mathbb{C} -vector spaces over E . One says that F is monodromic if it is locally constant along the orbits $\mathbb{C}^* \eta$ for each $\eta \in E \setminus Y$. The category of monodromic sheaves is a full abelian subcategory of $\text{Mod}(\mathbb{C}_E)$. An object $F \in D^b(\mathbb{C}_E)$ is monodromic if the sheaves $H^i(F)$ are monodromic for every $i \in \mathbb{Z}$. We denote by $D_{\text{mon}}^b(\mathbb{C}_E)$ the full subcategory of $D^b(\mathbb{C}_E)$ formed by monodromic objects.

Denote by p_1 and p_2 the canonical projections from $E \times_Y E'$ to E and E' , respectively, and set $P = \{(x, y) \in E \times_Y E' : \langle x, y \rangle \geq 0\}$. The Fourier–Sato transform is the functor $\mathcal{F}^{\mathbb{K}} : D_{\mathbb{R}^+}^+(\mathbb{K}_E) \rightarrow D_{\mathbb{R}^+}^+(\mathbb{K}_{E'})$ defined by $\mathcal{F}^{\mathbb{K}}(F) := \mathbb{R}p_{2*} \circ \mathbb{R}\Gamma_P \circ p_1^{-1}(F)$.

LEMMA 5.38. *Let $F \in D_{\mathbb{R}^+}^+(\mathbb{C}_E^h)$. Then $\mathcal{F}^{\mathbb{C}^h}(F) \simeq \mathcal{F}^{\mathbb{C}}(F)$ in $D_{\mathbb{R}^+}^+(\mathbb{C}_{E'})$.*

Proof. Let $i : P \rightarrow E \times_Y E'$ be the embedding of P . Then $\mathbb{R}\Gamma_P \simeq \mathbb{R}i_! i^!$. Since $i^!$ and p_1^{-1} are exact functors, the result follows by Lemma 5.19. \square

In particular, if $F \in D_{\text{mon}}^b(\mathbb{C}_E)$, then $\mathcal{F}^{\mathbb{C}}(F) \in D_{\text{mon}}^b(\mathbb{C}_{E'})$.

In the case $E = T_Y X$, $E' = T_Y^* X$ and $\mathcal{F}^{\mathbb{K}} : D_{\mathbb{R}^+}^+(\mathbb{K}_{T_Y X}) \rightarrow D_{\mathbb{R}^+}^+(\mathbb{K}_{T_Y^* X})$, the composition $\mu_Y^{\mathbb{K}} := \mathcal{F}^{\mathbb{K}} \circ \nu_Y^{\mathbb{K}} : D^b(\mathbb{K}_X) \rightarrow D_{\mathbb{R}^+}^b(\mathbb{K}_{T_Y^* X})$ is called the geometrical micro-localization (see [6]).

By Lemmas 5.19 and 5.38, one has the following.

LEMMA 5.39. *For $F \in D^b(\mathbb{C}_X^h)$ the objects $\mu_Y^{\mathbb{C}^h}(F)$ and $\mu_Y^{\mathbb{C}}(F)$ are isomorphic in $D^b(\mathbb{C}_{T_Y^* X})$.*

5.6.2. Review on Fourier transform and micro-localization for \mathcal{D} -modules. Denote by $\mathcal{D}_{[E]} \subset \pi_* \mathcal{D}_E$ the sheaf of differential operators polynomial in the fibres. Let θ denote the Euler field on E . A $\pi_*(\mathcal{D}_E)$ or a $\mathcal{D}_{[E]}$ -left coherent module \mathcal{N} is monodromic if \mathcal{N} is generated by local sections satisfying $b(\theta)u = 0$ for some non-vanishing $b(\theta) \in \mathbb{C}[\theta]$. We denote this category by $\text{Mod}_{\text{mon}}(\mathcal{D}_{[E]})$, a Serre subcategory of $\text{Mod}_{\text{coh}}(\mathcal{D}_{[E]})$.

Consider the sheaf $\Omega_{E/Y}$ of relative differential forms to $\pi : E \rightarrow Y$.

One defines an exact functor \mathcal{F} (Fourier transform, cf. [1]) from $\text{Mod}_{\text{mon}}(\mathcal{D}_{[E]})$ to $\text{Mod}_{\text{mon}}(\mathcal{D}_{[E']})$ setting for $\mathcal{N} \in \text{Mod}_{\text{mon}}(\mathcal{D}_{[E]})$:

$$\mathcal{F}(\mathcal{N}) := \Omega_{E/Y} \otimes_{\pi^{-1}\mathcal{O}_Y} \mathcal{N}.$$

Recall that for each $\mathcal{N} \in \text{Mod}_{\text{mon}}(\mathcal{D}_{[E]})$ one constructs canonical isomorphisms in $D^b(\mathbb{C}_{E'})$:

$$\mathcal{F}^{\mathbb{C}}(\text{Sol}(\mathcal{N})) \simeq \text{Sol}(\mathcal{F}(\mathcal{N}))[-\text{codim } Y]; \quad (30)$$

$$\mathcal{F}^{\mathbb{C}}(DR(\mathcal{N})) \simeq DR(\mathcal{F}(\mathcal{N}))[-\text{codim } Y]. \quad (31)$$

Consider $E = T_Y X$, $E' = T_Y^* X$ and denote by τ the projection $E' \rightarrow Y$. Let $\mathcal{M} \in \text{Mod}_{\text{sp}}(\mathcal{D}_X)$. Recall that the composition of \mathcal{F} with ν_Y gives an exact functor μ_Y from $\text{Mod}_{\text{sp}}(\mathcal{D}_X)$ to $\text{Mod}_{\text{mon}}(\mathcal{D}_{[T_Y^* X]})$, the micro-localization along Y (cf [13] for details).

5.7. Fourier transform and micro-localization for monodromic \mathcal{D}^h -modules.

Let \mathcal{S} be the full Serre substack of $\mathcal{M}od_{\text{coh}}(\mathcal{D}_{[E]}^h)$:

$$U \mapsto \mathcal{S}(U) = \bigcup_{n \geq 0} \text{Mod}_{\text{mon}}(\mathcal{D}_{[E],n}^h | U)$$

where we consider the structure of $\mathcal{D}_{[E]}$ -locally free module on $\mathcal{D}_{[E],n}^h$. We shall denote by $\text{Mod}_{\text{mon}}(\mathcal{D}_{[E]}^h)$ the category $\text{Mod}_{\mathcal{S}}(\mathcal{D}_{[E]}^h)$.

Similarly we denote by \mathcal{S}' the full Serre substack

$$V \mapsto \mathcal{S}'(V) = \bigcup_{n \geq 0} \text{Mod}_{\text{mon}}(\mathcal{D}_{[E'],n}^h | V).$$

Consider the functor $\Phi : \text{Op}(E) \rightarrow \text{Op}(E')$ given by $U \mapsto \tilde{\pi}^{-1}\pi(U)$. Since $\mathcal{F}(U) : \mathcal{S}(U) \rightarrow \mathcal{S}(\Phi(U))$ is clearly an exact functor, we are in conditions to apply Theorem 4.24 and extend it as an exact functor

$$\mathcal{F}^h : \text{Mod}_{\text{mon}}(\mathcal{D}_{[E]}^h) \rightarrow \text{Mod}_{\text{mon}}(\mathcal{D}_{[E']}^h)$$

setting

$$\mathcal{F}^h(\mathcal{N}) := \varprojlim_{n \geq 0} \mathcal{F}(\mathcal{N}_n) = \varprojlim_{n \geq 0} \Omega_{E/Y} \otimes_{\pi^{-1}\mathcal{O}_Y} \mathcal{N}_n.$$

DEFINITION 5.40. We define \mathcal{F}^h as the Fourier transform for $\mathcal{D}_{[E]}^h$ -monodromic modules.

In view of Definition 4.21 and Theorem 4.24, we have functorial isomorphisms:

$$\mathcal{F}^h(\mathcal{N}) \simeq \Omega_{E|Y} \otimes_{\pi^{-1}\mathcal{O}_Y} \mathcal{N}$$

for $\mathcal{N} \in \text{Mod}_{\text{mon}}(\mathcal{D}_{[E]}^h)$.

One can restate Propositions 4.5 and 4.10, Theorem 4.16 and Corollaries 4.18 and 4.20 replacing the functor F^h by \mathcal{F}^h .

LEMMA 5.41.

(a) *Let \mathcal{N} be a monodromic $\mathcal{D}_{[E]}^h$ -module. Then $\mathcal{F}^h(\mathcal{N})$ is a monodromic $\mathcal{D}_{[E']}^h$ -module.*

- (b) Let \mathcal{M} be a specializable \mathcal{D}_X^h -module. Then $v_Y^h(\mathcal{M})$ is a monodromic $\mathcal{D}_{T_Y X}^h$ -module.

Proof. The first property results from the formulas $\mathcal{F}^h(\mathcal{N})_0 \simeq \mathcal{F}(\mathcal{N}_0)$ and ${}_0\mathcal{F}^h(\mathcal{N}) \simeq \mathcal{F}({}_0\mathcal{N})$.

The second one is a consequence of the same property for \mathcal{D}_X -modules and the formulas,

$$v_Y^h(\mathcal{M})_0 \simeq v_Y(\mathcal{M}_0), \quad v_Y^h(\mathcal{M}) \simeq v_Y({}_0\mathcal{M}).$$

□

DEFINITION 5.42. The functor of micro-localization for \mathcal{D}_X^h -modules along a submanifold Y is given by:

$$\begin{aligned} \mu_Y^h : \text{Mod}_{\text{sp}}(\mathcal{D}_X^h) &\rightarrow \text{Mod}_{\text{mon}}(\mathcal{D}_{[T_Y^*, X]}^h) \\ \mathcal{M} &\mapsto \mu_Y^h(\mathcal{M}) := \mathcal{F}^h(v_Y^h(\mathcal{M})). \end{aligned}$$

Since all the functors involved are exact and take values in subcategories of coherent modules, we conclude functorial isomorphisms:

$$\mu_Y^h(\mathcal{M}) \simeq \varprojlim_{n \geq 0} \mu_Y(\mathcal{M}_n),$$

for $\mathcal{M} \in \text{Mod}_{\text{sp}}(\mathcal{D}_X^h)$.

Similarly we conclude:

THEOREM 5.43. We have natural isomorphisms in $D^b(\mathbb{C}_{T_Y^* X}^h)$:

$$\begin{cases} \mathcal{F}(\text{Sol}_{\bar{h}}(\mathcal{N})) \simeq \text{Sol}_{\bar{h}}(\mathcal{F}^h(\mathcal{N}))[-\text{codim } Y] \\ \mathcal{F}(\text{DR}_{\bar{h}}(\mathcal{N})) \simeq \text{DR}_{\bar{h}}(\mathcal{F}^h(\mathcal{N}))[-\text{codim } Y] \end{cases}$$

for $\mathcal{N} \in \text{Mod}_{\text{mon}}(\mathcal{D}_{T_Y X}^h)$.

COROLLARY 5.44. We have natural isomorphisms in $D^b(\mathbb{C}_{T_Y^* X}^h)$:

$$\begin{cases} \text{Sol}_{\bar{h}}(\mu_Y^h(\mathcal{M})) \simeq \mu_Y(\text{Sol}_{\bar{h}}(\mathcal{M}))[\text{codim } Y] \\ \text{DR}_{\bar{h}}(\mu_Y^h(\mathcal{M})) \simeq \mu_Y(\text{DR}_{\bar{h}}(\mathcal{M}))[\text{codim } Y] \end{cases}$$

for $\mathcal{M} \in \text{Mod}_{\text{rh}}(\mathcal{D}_X^h)$.

ACKNOWLEDGEMENTS. The research of T. Monteiro Fernandes was supported by Fundação para a Ciência e Tecnologia, PEst OE/MAT/UI0209/2011. The research of D. Raimundo was supported by Fundação para a Ciência e Tecnologia and Programa Ciência, Tecnologia e Inovação do Quadro Comunitário de Apoio and by Fundação Calouste Gulbenkian (Programa Estímulo à Investigação). We thank Stephane Guillermou not only for pointing out inaccuracies but also for his useful suggestions.
