were strongly and positively correlated with the following DERS subscores: Non acceptance of emotional responses (r=0.328**), Difficulties engaging in goal directed behaviors (r=0.366**), Impulse control difficulties (r=0.238**), Limited access to emotional regulation strategies (r=0.311**), and Lack of emotional clarity (r=0.311**).

Conclusions: Problematic internet use seems to emerge as part of a cluster of symptoms related to ineffective emotion regulation skills. Hence, training for affective regulation abilities appears strategically useful in the control of Internet use.

Co-use of tobacco and cannabis: Complicated partnerships
I. Ganhao1*, M. Trigo2 and A. Paixao3
1Smoking Reduction And Cessation Programme, Centro Hospitalar Psiquiatrico de Lisboa, Lisbon, Portugal; 2Psychology Unit, Centro Hospitalar Psiquiatrico de Lisboa, Lisbon, Portugal and 3Clinic 4, Centro Hospitalar Psiquiatrico de Lisboa, Lisbon, Portugal

Introduction: Treating addiction is more challenging when there are co-addictions. Tobacco smoking is commonly associated with substance abuse, alcohol use disorders, excessive caffeine intake and pathological gambling among other addictions. Smoking reduction and cessation programmes’ objectives benefit from interventions targeting co-addictions.

Objectives: Difficulties arising from smoking reduction and cessation in the context of co-use of cannabis prompt literature review and reflection of a smoking cessation programme team.

Methods: Pubmed and Google Scholar literature search using terms smoking cessation / tobacco cessation and cannabis.

Results: Co-use of tobacco and cannabis is: 1) very common, 2) associated with greater prevalence of morbidity and social problems, 3) associated with greater dependence of the other substances, 4) negatively influences quit outcomes of either, 5) increases the risk of relapse. Co-users are more likely to perceive the harmful effects of tobacco, have greater motivation and are more likely to quit tobacco than cannabis, which may be perceived as low risk. Treatment of either tobacco smoking or cannabis use may lead to compensatory increase in use of the other substance. There is a significant lack of literature on co-use treatment strategies.

Conclusions: Co-use of tobacco and cannabis makes cessation and relapse prevention of either addiction more difficult and should be taken into account in smoking reduction and cessation programmes and in cannabis treatment interventions. Treatment targeting both tobacco and cannabis use, either simultaneously or sequentially, is likely more successful than interventions targeting only either one. Much remains to be studied on how to treat co-use of tobacco and cannabis.

Comparative study of psychoactive substance use pattern in Romania and Hungary
C.R. Costescu1, B. Nemeș, H.G. Coman and D. Cozman
Medical Psychology, “Iuliu Hatieganu” University of Medicine and Pharmacy, Cluj-Napoca, Romania
*Corresponding author. doi: 10.1192/j.eurpsy.2021.1535

Introduction: Europe’s drug situation is facing an increasing trend.

Objectives: To compare the psychoactive substance use pattern in Romania and Hungary.

Methods: Data was collected from the electronic databases of the 3rd Psychiatry Clinic of Cluj County Emergency Hospital, Cluj-Napoca, Romania and from the Psychiatry Department of Kenezy Gyula Hospital Debrecen, Hungary. We included adult patients who had at least one hospital admission for mental and behavioral disorders due to psychoactive substance use between 01/01/2013 and 31/12/2016.

Results: 96 patients from Romania (80.2% males, mean age 27.8 years (18, 82)) and 816 from Hungary (71.93% males, mean age 47 years (18, 90)) were included. Romanian patients consumed more opioids (31.52% vs 4.34%, p<0.05 Chi-square Test), cannabinoids (66.3% Ro vs 13.04%, p<0.001 Chi-square Test), and synthetic drugs (declared 73.91% vs 8.21%, p<0.001 Chi-square Test), an underlying personality disorder (52.08% vs 34.06%, p=0.001 Chi-square test) was more often diagnosed. Hungarian patients consumed more alcohol (89.46% vs 30.43%, p<0.001 Chi-square Test), a comorbid bipolar disorder (18.75% vs 5.2%, p=0.001 Chi-square Test), a major depressive disorder (40.8% vs 16.6% p<0.001, Chi-square Test) or an anxiety spectrum disorder (55.26% vs 7.29%, p<0.001 Chi-square test) were more often diagnosed. Overall, more than 85% had a dependence use pattern, more than 65% having multiple admissions.

Conclusions: Romanian drug users are younger, prefer opioids, cannabinoids and synthetic drugs and have more often a comorbid personality disorder than Hungarian patients, who consume more alcohol and have a comorbid affective disorder.

Treating addiction with psychedelics - are we waking up?
J. Miranda1*, M. Barbosa1, I. Figueiredo2, P. Mota3 and A. Tarelho1
1Mental Health Department, Centro Hospitalar de Leiria, Leiria, Portugal; 2Mental Health Department, Hospital Professor Doutor Fernando Fonseca, Lisboa (Amadora), Portugal and 3Departamento De Psiquiatria E Saúde Mental, Centro Hospitalar do Tâmega e Sousa, Guimarães, Portugal

Introduction: Classic psychedelics have been administered in sacramental contexts since ancient times. They were of prominent interest within psychiatry and neuroscience in the 1950s to 1960s, but the association between classic psychedelics and the emerging counterculture put an end to their research. Modern research with
classic psychedelics has reinitiated interest in the treatment of both cancer-related distress and addiction, with really promising results.

**Objectives:** We aim to provide a review about history and new insights regarding research with psychedelics specially as treatment of addictive disorders.

**Methods:** A framing analysis of articles, searched on Pubmed (articles between 2010-2020) with the key words: "psychedelics", "psilocybin", "substance use disorder", "addiction".

**Results:** Classic psychedelics are 5HT2AR agonists such as LSD, mescaline, and psilocybin. They were shown to occasion mystical experiences, which are experiences reported throughout different cultures and religions involving a strong sense of unity. These experiences are scientifically important because they appear to cause abrupt and sustained changes in behavior and perception, that can be very useful in the substance use disorder field. From this analysis is possible to understand that the use of psychedelics in the treatment of some addictions is currently at an early stage of research. However, they show interesting results with no clinically significant adverse events when risk individuals are excluded.

**Conclusions:** In comparison to psychedelic research about cancer-related psychological distress, studies with addictions are less developed, but if they continue to suggest safety and efficacy, may be the use of psilocybin for the treatment of specific addiction can happen in a close future.

**Introduction:** Substance use disorder (SUD) in patients with ADHD symptoms is associated with a poorer treatment prognosis. The study is aimed to investigate psychosocial risks factors for developing SUD in patients with ADHD.

**Objectives:** To examine the associations between self-reported weak academic performance, repetition of a grade, single – parent family, self-reported quality of parent – child relationship, conduct problems in childhood and SUD in adulthood in a sample of outpatients with ADHD symptoms of an addiction medicine clinic in Riga, Latvia.

**Methods:** Self-report surveys, containing Adult ADHD Self-Report Scale (ASRS-v I.I), were completed by outpatients of addiction clinic, including healthy control subjects (adults without addiction, formally assessed for fitness to drive, firearms licensing etc.). Patients then were examined in relation to childhood risk factors.

**Results:** Survey was compleated by 341 outpatients – 98 (28,7%) healthy controls and 243 (71,3%) patients with SUD (mean age, 36,8 and 37,7, respectively; 76,4% males). 62 (18,1%) patients were tested positive for ADHD, of whom 12 (19,4%) were healthy sub-
