### PAROLEINE ATOMISERS

(B., W. & Co.).

It has been stated on good authority that the inhalation of medicated vapours is of decided benefit in the treatment of catarrhal conditions of the naso-pharyngeal mucous membrane and affections of the lungs and air passages. For a long time doubts existed as to the possibility of inhaled particles passing the glottis; very probably the objections raised had some foundation in fact when steam inhalations were employed, the majority of the vapour condensing before it reached the trachea. The case is different where an oily solution is employed for atomisation, as the minute particles are conveyed with each inspiration into the lungs and air passages, and by reason of the oily consistency are kept in prolonged contact with the mucous membrane. Many eminent throat specialists have raised objections to the indiscriminate employment of hot steam inhalations in the treatment of throat affections, because by this method the tissues are unduly relaxed, and the system is rendered less able to resist unfavourable influences.

B., W. & Co. Post-Nasal Ointment Atomiser. Price, 5s. 2d.

B., W. & Co. Naso-Pharyngeal Contment Atomiser. Price, 3s. 5d.

The B., W. & Co.'s Ointment Atomisers are more easily used than the ordinary complicated instruments; they are very portable, simply constructed, and easily freed from all traces of medicament. Many of the remedies commonly employed in throat diseases are insoluble in water, and other solvents usually employed are contra-indicated on account of their irritating influence on the mucous membrane.

The introduction of Paroleine is a decided advance in therapeutics. This substance is of an oily consistency, is free from taste, odour, and colour, and is a good solvent for many of the medicaments employed for inhalation.

For the application of the spray the container is held firmly in the left hand, and after placing the nozzle inside the nostril the bulb should be firmly compressed; at the same time the patient takes an inspiration. By these means the spray is spread entirely over the surface of the anterior nares. When it is desirable to apply the spray to the supra-glottic surfaces and the air passages, the nozzle is inserted in the mouth, and with each compression of the bulb a deep inspiration is taken, which causes the spray to be distributed generally over the entire mucous surfaces; the mucous membrane is thus covered with a thin film of the remedy. A decided advantage in favour of the B., W. & Co., OINTMENT ATOMISERS is that they may be employed at any time without any danger accruing from change of temperature.

May be obtained from all first-class Pharmacists and Wholesale Drug Houses.
