OSCILLATION OF NEUTRAL DELAY DIFFERENTIAL EQUATIONS

Jianshe Yu, Zhicheng Wang and Chuanxi Qian

Consider the following neutral delay differential equation

\[ \frac{d}{dt}[x(t) + P x(t - \tau)] + Q(t) x(t - \sigma) = 0, \quad t \geq t_0 \]

where \( P \in \mathbb{R}, \tau \in (0, \infty), \sigma \in [0, \infty) \) and \( Q \in C([t_0, \infty), [0, \infty]) \). We obtain a sufficient condition for the oscillation of all solutions of Equation (*) with \( P = -1 \), which does not require that

\[ \int_{t_0}^{\infty} Q(s) \, ds = \infty. \] (**)

But, for the cases \(-1 < P < 0 \) and \( P < -1 \), we show that (**) is a necessary condition for the oscillation of all solutions of Equation (*). These new results solve some open problems in the literature.

1. INTRODUCTION

Consider the following neutral delay differential equation

\[ \frac{d}{dt}[x(t) + P x(t - \tau)] + Q(t) x(t - \sigma) = 0, \quad t \geq t_0 \]

where

\[ P \in \mathbb{R}, \quad \tau \in (0, \infty), \quad \sigma \in [0, \infty) \] and \( Q \in C([t_0, \infty), [0, \infty]) \).

Recently, oscillation and asymptotic behaviours of Equation (1) have been investigated by several authors. (For a survey, see \[2\].) There is an interesting problem remaining. From all the known oscillation results for Equation (1) in the literature, it seems that

\[ \int_{t_0}^{\infty} Q(s) \, ds = \infty \] (3)

is an essential condition. Moreover, (3) is also a sufficient condition for the oscillation of all solutions of Equation (1) with \( P = -1 \), which has been established in \([3]\); see also \([1]\). Therefore, Chuanxi and Ladas posed the following question in \([1]\).
PROBLEM 1: Is condition (3) a necessary condition for the oscillation of all solutions of Equation (1) with \( P = -1 \)?

In addition, Györi and Ladas recently put forward the following question in [2, Problem 6.12.10(a)].

PROBLEM 2: In the case \(-1 \leq P < 0\), find sufficient conditions for the oscillation of all solutions of Equation (1) under the indicated restrictions on the function \( Q \) and the delays \( r \) and \( \sigma \). Do not assume that (3) holds.

Our aim in this paper is to answer the above equations. We shall provide a sufficient condition which is weaker than (3) for the oscillation of all solutions of Equation (1) with \( P = -1 \). In addition, we shall show that if \(-1 < P < 0 \) (or \( P < -1 \)) and (3) does not hold, then Equation (1) has a nonoscillatory solution and so (3) is indeed a necessary condition for the oscillation of all solutions of Equation (1) with \(-1 < P < 0 \) (or \( P < -1 \)).

Let \( t_1 \geq t_0 \) and let \( \phi \in C[[t_1 - \rho, t_1], \mathbb{R}] \), where \( \rho = \max\{r, \sigma\} \). By a solution of (1) with initial function \( \phi \) at \( t_1 \) we mean a function \( x \in C[[t_1 - \rho, \infty), \mathbb{R}] \) such that \( x(t) = \phi(t) \) for \( t \in [t_1 - \rho, t_1] \), \( x(t) + Px(t - \tau) \) is continuously differentiable for \( t \geq t_1 \), and \( x(t) \) satisfies (1) for all \( t \geq t_1 \).

As usual, a solution of (1) is called oscillatory if it has arbitrarily large zeros and nonoscillatory if it is eventually positive or eventually negative.

In the sequel, for convenience, we shall assume that inequalities about values of functions are satisfied eventually for all large \( t \).

2. OSCILLATION OF EQUATION (1) WITH \( P = -1 \)

In this section, we study the oscillation of Equation (1) with \( P = -1 \). The following theorem is the main result.

**Theorem 1.** Assume that (2) holds with \( P = -1 \). Suppose also

\[
\int_{t_0}^{\infty} sQ(s) \left( \int_{t}^{\infty} Q(t) dt \right) ds = \infty.
\]

Then every solution of Equation (1) oscillates.

**Proof:** Since (3) implies that all the solutions of Equation (1) oscillate, it suffices to show that all solutions of Equation (1) oscillate in the case that

\[
\int_{t_0}^{\infty} Q(s) ds < \infty.
\]

Assume, for the sake of contradiction, that Equation (1) has an eventually positive solution \( x(t) \). Then there exists \( t_1 \geq t_0 \) such that

\[
x(t - \rho) > 0 \quad \text{for} \quad t \geq t_1
\]
where $\rho = \max\{\tau, \sigma\}$. Set $y(t) = x(t) - x(t - \tau)$. Then

$$y'(t) = -Q(t)x(t - \sigma) \leq 0, \quad t \geq t_1$$

which implies that $y(t)$ is nonincreasing for $t \geq t_1$. Therefore $y(t)$ is eventually negative or eventually positive.

First, we assume that $y(t) < 0$ eventually. Since $y(t)$ is nonincreasing, there exists $\alpha > 0$ and $T \geq t_1$ such that

$$y(t) < -\alpha \text{ for } t \geq T.$$

Therefore

$$x(T) = y(T) + x(T - \tau) < -\alpha + x(T - \tau)$$

and it follows that

$$x(T + n\tau) < -(n + 1)\alpha + x(T - \tau) \to -\infty \text{ as } n \to \infty$$

which contradicts (6). Thus, $y(t)$ cannot be eventually negative.

Next, we assume that $y(t) > 0$ eventually. In this case, we have $x(t) > x(t - \tau)$. Hence, there exists $M > 0$ and $T' \geq t_1$ such that $x(t - \rho) > M$ for $t \geq T'$. Then from (7), it follows that

$$y'(t) \leq -MQ(t) \text{ for } t \geq T'.$$

Hence

$$y(t) \geq M \int_t^{T'} Q(s) \, ds \text{ for } t \geq T'$$

and so

$$x(t) \geq M \int_t^{T'} Q(s) \, ds + x(t - \tau) \text{ for } t \geq T'.$$

Let $T' + n\tau \leq t \leq T' + (n + 1)\tau$. Then we have

$$x(t) \geq M \int_t^{T'} Q(s) \, ds + M \int_{t-\tau}^{T'} Q(s) \, ds + \ldots + M \int_{t-(n-1)\tau}^{T'} Q(s) \, ds + x(t - n\tau)$$

which, together with (7), yields

$$y'(t) \leq -nMQ(t) \int_t^{T'} Q(s) \, ds \triangleq -H(t).$$

By noting that $t/n \to \tau$ as $t \to \infty$, we see that

$$\frac{H(t)}{tQ(t) \int_t^{T'} Q(s) \, ds} = \frac{nM}{t} \to \frac{M}{\tau} \text{ as } t \to \infty.$$
Clearly, (4) and (11) imply that

\[
\int_{t_0}^{\infty} H(s)ds = \infty.
\]

Then (10) and (12) yield

\[ y(t) \rightarrow -\infty \text{ as } t \rightarrow \infty \]

which contradicts the hypotheses that \( y(t) \) is eventually positive.

Therefore all the solutions of Equation (1) oscillate. The proof is complete. \[ \square \]

REMARK 1. Clearly, (4) is weaker than (3). Hence, Theorem 1 is an improvement of the known result in [3] mentioned above and gives Problem 1 a negative answer.

EXAMPLE 1. Consider the following neutral delay differential equation

\[
\frac{d}{dt}[x(t) - x(t - \tau)] + \frac{1}{t^n} x(t - \sigma) = 0
\]

where \( \alpha \in (1, 3/2] \). It is easy to see that (4) holds. Then by Theorem 1, every solution of Equation (13) oscillates. However, condition (3) is not satisfied.

3. NONOSCILLATION OF EQUATION (1) WITH \(-1 < P \leq 0\) OR \(P < -1\)

In this section, we study the nonoscillation of Equation (1) with \(-1 < P \leq 0\) or \(P < -1\).

THEOREM 2. Assume that (2) holds with \(-1 < P \leq 0\). Suppose also that

\[
\int_{t_0}^{\infty} Q(s)ds < \infty.
\]

Then Equation (1) has a nonoscillatory solution.

PROOF: Choose a positive number \( T > t_0 \) sufficiently large such that for \( t \geq T \),

\[
t - \tau \geq t_0, \quad t - \sigma \geq t_0 \quad \text{and} \quad \int_{t}^{\infty} Q(s)ds \leq \frac{1 + P}{2}.
\]

Let \( X \) be the set of all continuous and bounded functions on \([t_0, \infty)\) with the sup-norm. Then \( X \) is a Banach space. Set

\[
A = \{x \in X: 1 \leq x(t) \leq 2 \text{ for } t \geq t_0\}.
\]

Then \( A \) is a bounded, closed and convex subset of \( X \). Define a mapping \( S: A \rightarrow X \) as

\[
(Sx)(t) = \begin{cases} 
1 + P - \frac{P}{t^n} x(t - \tau) + \int_{t}^{\infty} Q(s)x(s - \sigma)ds, & t \geq T \\
(Sx)(T), & t_0 \leq t \leq T.
\end{cases}
\]
Neutral delay differential equations

Clearly, $S$ is continuous. For every $x \in A$ and $t \geq T$ we see that

$$(Sx)(t) \leq 1 + P - 2P + 2(1 + P)/2 = 2$$

and

$$(Sx)(t) \geq 1 + P - P + 0 = 1.$$ Hence, $1 \leq (Sx)(t) \leq 2$ for $t \geq t_0$ and so $SA \subset A$.

Now we show that $S$ is a contraction mapping on $A$. In fact, for every $x_1, x_2 \in A$ and $t \geq T$ we have

$$|(Sx_1)(t) - (Sx_2)(t)| \leq |P| |x_1(t - \tau) - x_2(t - \tau)| + \int_{t}^{\infty} Q(s) |x_1(s - \sigma) - x_2(s - \sigma)| ds$$

$$\leq \|x_1 - x_2\| \left[-P + (1 + P)/2\right]$$

$$= (1 - P)/2 \|x_1 - x_2\|.$$ Then it follows that

$$\|Sx_1 - Sx_2\| = \sup_{t \geq t_0} |(Sx_1)(t) - (Sx_2)(t)|$$

$$= \sup_{t \geq T} |(Sx_1)(t) - (Sx_2)(t)|$$

$$\leq (1 - P)/2 \|x_1 - x_2\|.$$ Since $(1 - P)/2 < 1$, we see that $S$ is a contraction. Then by the Banach Contraction principle, $S$ has a fixed point $x \in A$, that is, $Sx = x$. Clearly, $x(t)$ is a positive solution of Equation (1) on $[T, \infty)$ and so the proof is complete.

**Theorem 3.** Assume that (2) holds with $P < -1$ and that (14) holds. Then Equation (1) has a nonoscillatory solution.

**Proof:** Let $T \geq t_0$ be sufficiently large such that

$$t - \sigma \geq t_0 \text{ and } \int_{t+\tau}^{\infty} Q(s) ds \leq -(1 + P)/2 \text{ for } t \geq T.$$ Let $X$ be the set of all continuous and bounded functions on $[t_0, \infty)$ with the sup-norm. Set

$$A = \{x \in X: - (1 + P)/2 \leq x(t) \leq -P \text{ for } t \geq t_0\}.$$ Then $A$ is a bounded, closed and convex subset of $X$. Define a mapping $S: A \to X$ as

$$(Sx)(t) = \begin{cases} -(1 + P) - \frac{1}{P} \geq x(t + \tau) + \frac{1}{P} \int_{t+\tau}^{\infty} Q(s)x(s - \sigma) ds, & t \geq T \\ (Sx)(T), & t_0 \leq t \leq T. \end{cases}$$
Then by an argument similar to that in the proof of Theorem 2, we see that $SA \subset A$ and for every $z_1, z_2 \in A$

$$\|Sz_1 - Sz_2\| \leq \left(\frac{1}{p}\right) \left(1 - \frac{1 + P}{2}\right) \|z_1 - z_2\| = \frac{-1 + P}{2P} \|z_1 - z_2\|.$$  

$S$ is a contraction since $0 < (-1 + P)/(2P) < 1$. Then by the Banach contraction principle, $S$ has a fixed point $z \in A$. Clearly, $z(t)$ is a positive solution of Equation (1) on $[T, \infty)$ and so the proof is complete.

**Remark 2.** Clearly, Theorems 2 and 3 imply that (3) is a necessary condition for the oscillation of all solutions of Equation (1) with $-1 < P < 0$ or $P < -1$. Hence, Theorem 2 and Theorem 1 give Problem 2 a complete answer, that is, for the case that $-1 < P < 0$ we could not find any sufficient conditions, but for case that $P = -1$, we indeed can find some sufficient conditions for the oscillation of all solutions of Equation (1) without hypothesis (3).
