Variational Principles in Mathematical Physics, Geometry, and Economics

Qualitative Analysis of Nonlinear
Equations and Unilateral Problems
ALEXANDRU KRISTÁLY
VICENȚIU D. RĂDULESCU
CSABA GYÖRGY VARGA

Encyclopedia of Mathematics and its Applications

\$99.00: Hb: 978-0-521-11782-1: 384 pp.

Conformal Fractals Ergodic Theory Methods

FELIKS PRZYTYCKI
MARIUSZ URBAŃSKI

*London Mathematical Society
Lecture Note Series*

Contents:

Introduction; Basic examples and definitions; 1. Measure preserving endomorphisms; 2. Compact metric spaces; 3. Distance expanding maps; 4. Thermodynamical formalism; 5. Expanding repellers in manifolds and in the Riemann sphere, preliminaries; 6. Cantor repellers in the line, Sullivan's scaling function, application in Feigenbaum universality; 7. Fractal dimensions; 8. Conformal expanding repellers; 9. Sullivan's classification of conformal expanding repellers; 10. Holomorphic maps with invariant probability measures of positive Lyapunov exponent; 11. Conformal measures; References; Index.

\$78.00: Pb: 978-0-521-43800-1: 364 pp.

Geometric Analysis of Hyperbolic Differential Equations: An Introduction

S. ALINHAC

*London Mathematical Society
Lecture Note Series*

Its self-contained presentation and 'do-it-yourself' approach make this the perfect guide for graduate students and researchers wishing

to access recent literature in the field of nonlinear wave equations and general relativity. It introduces all of the key tools and concepts from Lorentzian geometry (metrics, null frames, deformation tensors, etc.) and provides complete elementary proofs. The author also discusses applications to topics in nonlinear equations, including null conditions and stability of Minkowski space. No previous knowledge of geometry or relativity is required.

\$50.00: Pb: 978-0-521-12822-3: 128 pp.

Multidimensional Stochastic Processes as Rough Paths Theory and Applications

PETER K. FRIZ
NICOLAS B. VICTOIR

*Cambridge Studies in
Advanced Mathematics*

\$85.00: Hb: 978-0-521-87607-0:
670 pp.

Linear Partial Differential Equations and Fourier Theory

MARCUS PIVATO

"I love this bare-handed approach to PDEs. Pivato has succeeded in creating a deeply engaging introductory PDE text; confidence building hands-on work and theory are woven together in a

way that appeals to the intuition. Add to that the truly reasonable price, and you have the hands down winner in the field of introductory PDE books. The next time I teach introductory PDE's, I will use Pivato's new text."

—Kevin R. Vixie, Washington State University

\$120.00: Hb: 978-0-521-19970-4: 630 pp.

\$60.00: Pb: 978-0-521-13659-4

Prices subject to change.

INSTRUCTIONS FOR CONTRIBUTORS

Editorial Policy

The journal welcomes high quality contributions on topics closely related to dynamical systems and ergodic theory. Submissions in the field of differential geometry, number theory, operator algebra, differential, topological, symbolic, measurable dynamics and celestial and statistical mechanics are especially welcome. Expository survey papers and reviews of relevant books will be published from time to time.

Submission of typescripts

Two copies of the manuscript should be submitted to an executive or managing editor whose interest is closest to the material of their article. In case of doubt authors may send manuscripts to the Managing Editors at the University of Warwick. A paper may also be submitted electronically in postscript form as an attachment to an email, i.e. not in the body of an email. Please also send the \TeX file. If you are unable to do this, please submit the manuscript in printed form. The editor in charge of the paper will acknowledge receipt of the paper. **It is important that authors inform the editor of any changes of postal and/or e.mail address** while their paper is under consideration.

The editor will send the manuscript to the referee electronically, if possible, and also airmail a copy to him/her. However, the editor can decide if the material is inappropriate for the journal and will also make the final decision regarding acceptance or rejection. Should you need further information you should communicate in the first instance with the editor in charge of your paper. In an attempt to decrease the journal's backlog an editor may decline a submission (without using the normal refereeing process) if he/she considers that a 'reasonable' referee might not recommend the paper sufficiently strongly, or (possibly) if the paper is more than 30 pages long. Such summary action, with its inherent risk of unfairness, seems preferable to introducing a moratorium (the only other alternative) and has the advantage that delayed negative decisions might be avoided. This policy will be reviewed at a later date.

Submission of a paper is taken to imply that it has not been previously published and that it is not being considered for publication elsewhere. Authors of articles published in the journal assign copyright to Cambridge University Press (with certain rights reserved) and you will receive a copyright assignment form for signature on acceptance of your paper.

The journal strongly recommends submission of accepted papers in \LaTeX using the ETDS \LaTeX class file. Papers that use this class file will be processed more efficiently. A $\text{\LaTeX}2\epsilon$ file `etds.cls` is available via anonymous ftp from the Cambridge University Press site at `ftp.cup.cam.ac.uk` in the directory `/pub/texarchive/journals/latex/etds-cls/`. In case of difficulties with these files, please contact `etds@sunrise-setting.co.uk` or the Journal editorial office at `etds@maths.warwick.ac.uk`. Alternatively, authors may use "article" style.

On final acceptance of a paper, authors should send the \LaTeX source code on disc including the figures (line figures only) and all author-defined macro and style files, to the Managing Editors, together with a hard copy produced using the same file. Discs should be in Apple Mac or PC format and will not be returned. The publisher reserves the right to typeset any article by conventional means if the author's \TeX code presents problems in production.

Typescript

Papers should be typed, double-spaced, on one side only and with generous margins. The pages must be numbered.

The first page should give the title, the author's name and institution, and a short abstract intelligible to mathematicians.

The title, while brief, must be informative (e.g. *A new proof of the ergodic theorem*, whereas *Some applications of a theorem of Birkhoff* would be useless).

Notation

It is important that mathematician's expressions are clear to a printer (who is not a mathematician). For instance, n_k (n sub k) is common usage, but avoid if possible using c sub n sub k . Fractions are generally best expressed by a solidus. Complicated exponents like $\exp\{z^2 \sin \theta / (1 + y^2)\}$ should be shown in this and no other way.

In the typescript, italics, small capitals and capitals are specified by single, double and triple underlining. Bold-faced type is shown by wavy underlining.

It helps if displayed equations or statements which will be quoted later are numbered in order on the right of their line. They can then be referred to by, for example, 'from (7)'.
The author must enable the printer (if necessary by pencilled notes in the margin) to distinguish between similar symbols such as o , O , \circ , \bigcirc , 0 ; x , X , \times ; ϕ , Φ , \varnothing ; 1 , l ; ε , ϵ ; κ , k .

There is no need to underline Greek or script letters provided these are clearly typed. Any special symbols should be explained on a separate sheet of directions for the printer.

If an author wishes to mark the end of the proof of a theorem, the sign \square may be used.

Footnotes should be avoided.

Diagrams

Figures and drawings should be on separate sheets in black ink or produced by computer to comparable quality. Photocopies are acceptable only if they are as clear as the originals. *Symbols, legends and captions should be given on a transparent overlay*. Each text figure must be numbered as Figure 1, Figure 2, ... and its intended position clearly indicated in the typescript. The author's name in pencil must be on all separate sheets of diagrams. Figures should be used sparingly and only when they greatly clarify the exposition.

Tables

Tables should be numbered (above the table) and set out on separate sheets. Indicate the position of each in the text as for figures.

References

References should be collected at the end of the paper numbered in alphabetical order of the publisher's names. A reference to a book should give the title, in italics, and then in roman type the publisher's name and the place and year of publication:

[4] N. Dunford and J. T. Schwartz. *Linear Operators*. Part I. Wiley, New York, 1958.

A reference to a paper should give in italics the title of the periodical, the number of the volume and year, and the beginning and end pages of the paper. Titles should be abbreviated as in *Mathematical Reviews*:

[6] J. E. Littlewood. The 'pits effect' for functions in the unit circle. *J. Analyse Math.* **23** (1970), 236–268.

Proofs

Authors receive one set of proofs for correction. If excessive alterations to the original manuscript are requested after the paper has been typeset, the author will be charged the cost of resetting. For papers with more than one author the proofs are sent to the first named author unless the editor receives other instructions. **It is important that proofs are corrected and returned promptly.**

Offprints

No paper offprints are provided, but the corresponding author will be sent the pdf of the published article. Print offprints may be purchased at extra cost at proof stage.

This journal issue has been printed on FSC-certified paper and cover board. FSC is an independent, non-governmental, not-for-profit organization established to promote the responsible management of the world's forests. Please see www.fsc.org for information.

Ergodic theory and dynamical systems

VOLUME 30 PART 5 OCTOBER 2010

CONTENTS

<i>Akin, E., Glasner, E., Huang, W., Shao, S. and Ye, X.</i> Sufficient conditions under which a transitive system is chaotic	1277
<i>Ashwin, P. and Goetz, A.</i> Cone exchange transformations and boundedness of orbits	1311
<i>Bakhtin, V. I.</i> On t -entropy and variational principle for the spectral radius of weighted shift operators	1331
<i>Calegari, D. and Fujiwara, K.</i> Combable functions, quasimorphisms, and the central limit theorem	1343
<i>Demers, M. F.</i> Functional norms for Young towers	1371
<i>Ding, F., Pan, J., Wang, S. and Yao, J.</i> Only rational homology spheres admit $\Omega(f)$ to be union of DE attractors	1399
<i>Durieu, O. and Volný, D.</i> On sums of indicator functions in dynamical systems	1419
<i>Frantzikinakis, N., Johnson, M., Lesigne, E. and Wierdl, M.</i> Powers of sequences and convergence of ergodic averages	1431
<i>Gentile, G.</i> Quasi-periodic motions in strongly dissipative forced systems	1457
<i>Jenkinson, O. and Steel, J.</i> Majorization of invariant measures for orientation-reversing maps	1471
<i>Li, S. and Shen, W.</i> An improved real C^k Koebe principle	1485
<i>Luczak, A.</i> The eigenvectors of semigroups of positive maps on von Neumann algebras	1495
<i>Olivier, E.</i> Uniqueness of the measure with full dimension on sofic affine-invariant subsets of the 2-torus	1503
<i>Patrão, M.</i> Entropy and its variational principle for non-compact metric spaces	1529
<i>Pikula, R.</i> Enveloping semigroups of unipotent affine transformations of the torus	1543
<i>Pivato, M. and Yassawi, R.</i> Embedding Bratteli–Vershik systems in cellular automata	1561
<i>Qiao, J., Yin, Y. and Gao, J.</i> Feigenbaum Julia sets of singularities of free energy	1573
Papers to appear in forthcoming issues	1593
