# Minimal length elements of extended affine Weyl groups 

Xuhua He and Sian Nie

#### Abstract

Let $W$ be an extended affine Weyl group. We prove that the minimal length elements $w_{\mathcal{O}}$ of any conjugacy class $\mathcal{O}$ of $W$ satisfy some nice properties, generalizing results of Geck and Pfeiffer [On the irreducible characters of Hecke algebras, Adv. Math. 102 (1993), 79-94] on finite Weyl groups. We also study a special class of conjugacy classes, the straight conjugacy classes. These conjugacy classes are in a natural bijection with the Frobenius-twisted conjugacy classes of some $p$-adic group and satisfy additional interesting properties. Furthermore, we discuss some applications to the affine Hecke algebra $H$. We prove that $T_{w_{\mathcal{O}}}$, where $\mathcal{O}$ ranges over all the conjugacy classes of $W$, forms a basis of the cocenter $H /[H, H]$. We also introduce the class polynomials, which play a crucial role in the study of affine Deligne-Lusztig varieties He [Geometric and cohomological properties of affine Deligne-Lusztig varieties, Ann. of Math. (2) $\mathbf{1 7 9}$ (2014), 367-404].

## Introduction

0.1 Let $W$ be a finite Weyl group and $\mathcal{O}$ be a conjugacy class of $W$. In [GP93] and [GP00], Geck and Pfeiffer proved the following remarkable properties.
(1) For any $w \in \mathcal{O}$, there exists a sequence of conjugations by simple reflections that reduces $w$ to a minimal length element in $\mathcal{O}$, with the lengths of the elements in the sequence weakly decreasing.
(2) If $w$ and $w^{\prime}$ are both of minimal length in $\mathcal{O}$, then they are strongly conjugate.

Such properties play an important role in the study of finite Hecke algebras. They lead to the definition and determination of 'character tables' for finite Hecke algebras, analogous to character tables for finite groups. They also play a role in the study of Deligne-Lusztig varieties (see, for example, [OR08], [BR08], and [HL12]) and in the study of links between conjugacy classes in finite Weyl groups and unipotent conjugacy classes in reductive groups (see [Lus11a]).
0.2 The main purpose of this paper is to study minimal length elements in a conjugacy class of an (extended) affine Weyl group and to establish some remarkable properties. These properties play an important role in the study of affine Hecke algebras and $p$-adic groups. We will discuss some applications to affine Hecke algebras in §0.4. These properties also play a key role in the study of affine Deligne-Lusztig varieties, see [He14] and [GHN12].

The minimal length elements for some affine Weyl groups of classical types were first studied by the first author in [He10] using a case-by-case analysis. The method we use here is quite

[^0]
## X. He and S. Nie

different. We give a case-free proof that works for all cases, including the affine Weyl groups of exceptional type, which seem very difficult using the approach in [He10]. The present method is based on three main ingredients:
(1) the 'partial conjugation' method introduced in [He07];
(2) the geometric interpretation of the length function in terms of alcoves and Weyl chambers introduced in [HN12];
(3) straight conjugacy classes and Newton points.

The first two ingredients were also used by the authors in [HN12] to provide a case-free proof of the remarkable properties mentioned in $\S 0.1$ for finite Weyl groups.

The third ingredient is a new feature for affine Weyl groups. Not only is it a crucial ingredient that allows us to pass from the finite Weyl groups to affine Weyl groups; it also has independent interest. We will discuss this in more detail below.
0.3 For simplicity, we only consider (unextended) affine Weyl groups and (untwisted) conjugacy classes in the introduction. However, we will also cover the general case in this paper.

Let $P_{\mathbb{Q}}^{+}$be the set of dominant rational coweights. To each element $x$ in the affine Weyl group $W$, we may associate the dominant Newton point $\bar{\nu}_{x} \in P_{\mathbb{Q}}^{+}$(see §3.4). We call an element $x$ straight if $\ell(x)=\left\langle\bar{\nu}_{x}, 2 \rho\right\rangle$, where $\rho$ is the sum of fundamental weights. This is equivalent to saying that $\ell\left(x^{n}\right)=n \ell(x)$ for all $n \geqslant 0$. A conjugacy class is called straight if it contains a straight element. The minimal length elements in a straight conjugacy class are just the straight elements it contains. The notion of straight element/conjugacy class was first introduced by Krammer in [Kra09] to study the conjugacy problem.

The first author observed in [He10] that the straight conjugacy classes have a geometric meaning: there is a natural bijection between the set of Frobenius-twisted conjugacy classes of a $p$-adic group and the set of straight conjugacy classes of the corresponding affine Weyl group $W$. There is no known counterpart for finite Weyl groups.

We prove the following.
Theorem A (Theorem 2.9 and Theorem 3.8). Let $W$ be an affine Weyl group and $\mathcal{O}$ be a conjugacy class of $W$. Then we have the following.
(1) For any $w \in \mathcal{O}$, there exists a sequence of conjugations by simple reflections that reduces $w$ to a minimal length element in $\mathcal{O}$, with the lengths of the elements in the sequence weakly decreasing.
(2) If $w$ and $w^{\prime}$ are both of minimal length in $\mathcal{O}$, then they are strongly conjugate.
(3) If, moreover, $\mathcal{O}$ is straight, then any two minimal length elements are conjugate by 'cyclic shifts'.

Theorem B (Theorem 3.3 and Theorem 3.4). Let $W$ be an affine Weyl group. Then we have the following.
(1) The map $f: W \rightarrow P_{\mathbb{Q}}^{+}, x \mapsto \bar{\nu}_{x}$ is constant on each conjugacy class of $W$.
(2) The map $f$ induces a bijection from the set of straight conjugacy classes of $W$ to $f(W)$.
(3) Any conjugacy class $\mathcal{O}$ of $W$ can be 'reduced' to the unique straight conjugacy class in the fiber of $f(\mathcal{O})$ in the sense of Theorem 3.4.

The statement of Theorem 3.4 is technical and we do not include it here. We would like to point out that in fact Theorem B implies Theorem A. Moreover, Theorem B is a crucial ingredient in the study of affine Deligne-Lusztig varieties in [He14]. Theorem A is not enough for this purpose.

## Minimal length elements of extended affine Weyl groups

0.4 Now we discuss some applications to affine Hecke algebras.

The affine Hecke algebra $H$ is a free $\mathbb{Z}\left[q, q^{-1}\right]$-module with basis $T_{w}$ for $w$ ranges over elements in $W$. By the density theorem and the trace Paley-Wiener theorem [Kaz86], if $q$ is a power of a prime, then the trace function gives a natural bijection from the dual space of the cocenter $H /[H, H]$ to the space of the Grothendieck group of representations of $H$.

We prove the following.
Theorem C (Corollary 5.2 and Theorem 6.7). (1) Let $\mathcal{O}$ be a conjugacy class of $W$ and $w_{\mathcal{O}}$ be a minimal length representative. Then the image of $T_{w_{\mathcal{O}}}$ in the cocenter $H$ does not depend on the choice of a minimal length representative $w_{\mathcal{O}}$. We denote the image by $T_{\mathcal{O}}$.
(2) The set $\left\{T_{\mathcal{O}}\right\}$, where $\mathcal{O}$ ranges over all the conjugacy classes of $W$, is a basis of the cocenter $H /[H, H]$.

Here part (1) and the fact that $\left\{T_{\mathcal{O}}\right\}$ spans the cocenter follow from the special properties for $W$ discussed above, and the fact that $\left\{T_{\mathcal{O}}\right\}$ is a linearly independent set follows from the density theorem for affine Weyl groups, which will be proved in $\S 6$.

As a consequence, we have the following.
Theorem D (Theorem 5.3). For any $w \in W$, the image of $T_{w}$ in the cocenter of $H$ is a linear combination of $T_{\mathcal{O}}$ and the coefficients are the 'class polynomials' $f_{w, \mathcal{O}}$.

It is worth mentioning that the class polynomials are closely related to the affine DeligneLusztig varieties [He14, Theorem 6.1 and Proposition 8.3].

## 1. Preliminary

1.1 Let $S$ be a finite set and $\left(m_{s t}\right)_{s, t \in S}$ be a matrix with entries in $\mathbb{N} \cup\{\infty\}$ such that $m_{s s}=1$ and $m_{s t}=m_{t s} \geqslant 2$ for all $s \neq t$. Let $W$ be a group generated by $S$ with relations $(s t)^{m_{s t}}=1$ for $s, t \in S$ with $m_{s, t}<\infty$. We say that $(W, S)$ is a Coxeter group. Sometimes we just call $W$ itself a Coxeter group.

Let $\operatorname{Aut}(W, S)$ be the group of automorphisms of the group $W$ that preserve $S$. Let $\Omega$ be a group with a group homomorphism to $\operatorname{Aut}(W, S)$. Set $\tilde{W}=W \rtimes \Omega$. Then an element in $\tilde{W}$ is of the form $w \delta$ for some $w \in W$ and $\delta \in \Omega$. We have that $(w \delta)\left(w^{\prime} \delta^{\prime}\right)=w \delta\left(w^{\prime}\right) \delta \delta^{\prime} \in \tilde{W}$ with $\delta, \delta^{\prime} \in \Omega$. Since we are mainly interested in the action of $\Omega$ on $W$, we may assume without loss of generality that $\Omega$ is finite.

For $w \in W$ and $\delta \in \Omega$, we set $\ell(w \delta)=\ell(w)$, where $\ell(w)$ is the length of $w$ in the Coxeter group ( $W, S$ ). Thus $\Omega$ consists of length 0 elements in $\tilde{W}$. We sometimes call the elements in $\Omega$ basic elements in $\tilde{W}$.

We are mainly interested in the $W$-conjugacy classes in $\tilde{W}$. By [GKP00, Remark 2.1], for any $\delta \in \Omega$, the map $W \rightarrow \tilde{W}, w \mapsto w \delta$ gives a bijection between the $\delta$-conjugacy classes in $W$ and the $W$-conjugacy classes in $\tilde{W}$ that are contained in $W \delta$.
1.2 For $w, w^{\prime} \in \tilde{W}$ and $s \in S$, we write $w \xrightarrow{s} w^{\prime}$ if $w^{\prime}=s w s$ and $\ell\left(w^{\prime}\right) \leqslant \ell(w)$. We write $w \rightarrow w^{\prime}$ if there is a sequence $w=w_{0}, w_{1}, \ldots, w_{n}=w^{\prime}$ of elements in $\tilde{W}$ such that for any $k, w_{k-1} \xrightarrow{s} w_{k}$ for some $s \in S$.

We write $w \approx w^{\prime}$ if $w \rightarrow w^{\prime}$ and $w^{\prime} \rightarrow w$. In this case, we say that $w$ and $w^{\prime}$ are conjugate by 'cyclic shifts'. It is easy to see that $w \approx w$ ' if $w \rightarrow w^{\prime}$ and $\ell(w)=\ell\left(w^{\prime}\right)$.

We call $\tilde{w}, \tilde{w}^{\prime} \in \tilde{W}$ elementarily strongly conjugate if $\ell(\tilde{w})=\ell\left(\tilde{w}^{\prime}\right)$ and there exists $x \in W$ such that $\tilde{w}^{\prime}=x \tilde{w} x^{-1}$ and $\ell(x \tilde{w})=\ell(x)+\ell(\tilde{w})$ or $\ell\left(\tilde{w} x^{-1}\right)=\ell(x)+\ell(\tilde{w})$. We call $\tilde{w}, \tilde{w}^{\prime}$ strongly

## X. He and S. Nie

conjugate if there is a sequence $\tilde{w}=\tilde{w}_{0}, \tilde{w}_{1}, \ldots, \tilde{w}_{n}=\tilde{w}^{\prime}$ such that for each $i, \tilde{w}_{i-1}$ is elementarily strongly conjugate to $\tilde{w}_{i}$. We write $\tilde{w} \sim \tilde{w}^{\prime}$ if $\tilde{w}$ and $\tilde{w}^{\prime}$ are strongly conjugate. We write $\tilde{w} \tilde{\sim} \tilde{w}^{\prime}$ if $\tilde{w} \sim \delta \tilde{w}^{\prime} \delta^{-1}$ for some $\delta \in \Omega$.

The following result is proved in [GP93], [GKP00] and [He07] via a case-by-case analysis with the aid of computer for exceptional type. A case-free proof which does not rely on computer calculation was recently obtained in [HN12].
Theorem 1.1. Assume that $W$ is a finite Coxeter group. Let $\mathcal{O}$ be a conjugacy class in $\tilde{W}$ and $\mathcal{O}_{\text {min }}$ be the set of minimal length elements in $\mathcal{O}$. Then we have the following:
(1) for each $w \in \mathcal{O}$, there exists $w^{\prime} \in \mathcal{O}_{\min }$ such that $w \rightarrow w^{\prime}$;
(2) let $w, w^{\prime} \in \mathcal{O}_{\text {min }}$, then $w \sim w^{\prime}$.

The main purpose of this paper is to extend the above theorem to the cases of affine Weyl groups and to discuss its application to affine Hecke algebras. To do this, we first recall some basic facts on affine Weyl groups and Bruhat-Tits building.
1.3 Let $\Phi$ be a reduced root system and $W_{0}$ the corresponding finite Weyl group. Then ( $W_{0}, S_{0}$ ) is a Coxeter group, where $S_{0}$ is the set of simple reflections in $W_{0}$.

Let $Q$ be the coroot lattice spanned by $\Phi^{\vee}$ and

$$
W=Q \rtimes W_{0}=\left\{t^{\chi} w ; \chi \in Q, w \in W_{0}\right\}
$$

be the affine Weyl group. The multiplication is given by the formula $\left(t^{\chi} w\right)\left(t^{\chi^{\prime}} w^{\prime}\right)=t^{\chi+w \chi^{\prime}} w w^{\prime}$. Moreover, $(W, S)$ is a Coxeter group, where $S \supset S_{0}$ is the set of simple reflections in $W$.

The length function on $W$ is given by the following formula (see [IM65]):

$$
\ell\left(t^{\chi} w\right)=\sum_{\alpha, w^{-1}(\alpha) \in \Phi^{+}}|\langle\chi, \alpha\rangle|+\sum_{\alpha \in \Phi^{+}, w^{-1}(\alpha) \in \Phi^{-}}|\langle\chi, \alpha\rangle-1| .
$$

1.4 Let $V=Q \otimes_{\mathbb{Z}} \mathbb{R}$. Then we have a natural action of $\tilde{W}$ on $V$. For $x, y \in V$, define $(x, y)=$ $\sum_{\alpha \in \Phi}\langle x, \alpha\rangle\langle y, \alpha\rangle$. Then by [Bou02, ch. VI, §1, no.1, Proposition 3], (, ) is a positive-definite symmetric bilinear form on $V$ invariant under $W$. We define the norm $\|\cdot\|: V \rightarrow \mathbb{R}$ by $\|x\|=$ $\sqrt{(x, x)}$ for $x \in V$.

For $\alpha \in \Phi$ and $k \in \mathbb{Z}$, define $H_{\alpha, k}=\{x \in V ;\langle x, \alpha\rangle=k\}$. Let $\mathfrak{H}=\left\{H_{\alpha, k} ; \alpha \in \Phi, k \in \mathbb{Z}\right\}$. For each hyperplane $H \in \mathfrak{H}$, let $s_{H} \in W$ be the orthogonal reflection with respect to $H$. Connected components of $V-\bigcup_{H \in \mathfrak{H}} H$ are called alcoves. We denote by $\bar{A}$ the closure of an alcove $A$. We denote by $\Delta$ the fundamental alcove, i.e. the alcove in the dominant chamber such that $0 \in \bar{\Delta}$.

Let $H \in \mathfrak{H}$. If the interior $H_{A}=(H \cap \bar{A})^{\circ} \subset H \cap \bar{A}$ spans $H$, then we call $H$ a wall of $A$ and $H_{A}$ a face of $A$.

For $p \neq q \in V$, we denote by $L(p, q) \subset V$ the affine subspace spanned by $p$ and $q$.
Let $K \subset V$ be a convex subset. We call $x \in K$ a regular point of $K$ if, for any $H \in \mathfrak{H}, x \in H$ implies that $K \subset H$. It is clear that all the regular points of $K$ form an open dense subset of $K$.
1.5 The action of $\tilde{W}$ on $V$ sends hyperplanes in $\mathfrak{H}$ to hyperplanes in $\mathfrak{H}$ and thus induces an action on the set of alcoves. It is known that the affine Weyl group $W$ acts simply transitively on the set of alcoves. For any alcove $A$, we denote by $x_{A}$ the unique element in $W$ such that $x_{A} \Delta=A$.

For any $\tilde{w} \in \tilde{W}$ and alcove $A$, set $\tilde{w}_{A}=x_{A}^{-1} \tilde{w} x_{A}$. Then any element in the $W$-conjugacy class of $\tilde{w}$ is of the form $\tilde{w}_{A}$ for some alcove $A$.

## Minimal length elements of extended affine Weyl groups

For any two alcoves $A, A^{\prime}$, let $\mathfrak{H}\left(A, A^{\prime}\right)$ denote the set of hyperplanes in $\mathfrak{H}$ separating them. Then $H \in \mathfrak{H}(\Delta, \tilde{w} \Delta)$ if and only if $\tilde{w}^{-1} \alpha$ is a negative affine root, where $\alpha$ is the positive affine root corresponding to $H$. In this case, $\ell\left(s_{H} \tilde{w}\right)<\ell(\tilde{w})$. We also have that $\ell(\tilde{w})=\sharp \mathfrak{H}(\Delta, \tilde{w} \Delta)$.

## 2. Minimal length elements in affine Weyl groups

Unless otherwise stated, we write $W_{0}$ for finite Weyl group and $W$ for affine Weyl group in the rest of this paper.
2.1 Similar to [HN12], we may view conjugation by a simple reflection in the following way.

Let $A, A^{\prime}$ be two alcoves with a common face $H_{A}=H_{A^{\prime}}$, here $H \in \mathfrak{H}$. Let $s_{H}$ be the reflection along $H$ and set $s=x_{A}^{-1} s_{H} x_{A}$. Then $s \in S$. Now

$$
\tilde{w}_{A^{\prime}}=\left(s_{H} x_{A}\right)^{-1} \tilde{w}\left(s_{H} x_{A}\right)=s x_{A}^{-1} \tilde{w} x_{A} s=s \tilde{w}_{A} s
$$

is obtained from $\tilde{w}_{A}$ by conjugating the simple reflection $s$. Similar to [HN12, Lemma 1.1], we have the following criterion to check if $\ell\left(\tilde{w}_{A^{\prime}}\right)>\ell\left(\tilde{w}_{A}\right)$.

Lemma 2.1. We keep the notation as above. Define $f_{\tilde{w}}: V \rightarrow \mathbb{R}$ by $v \mapsto\|\tilde{w}(v)-v\|^{2}$. Let $h$ be a regular point in $H_{A}$ and $v \in V$ such that $\left(v, h-h^{\prime}\right)=0$ for all $h^{\prime} \in H_{A}$ and $h-\epsilon v \in A$ for sufficient small $\epsilon>0$. Set

$$
D_{v} f_{\tilde{w}}(h)=\lim _{t \rightarrow 0} \frac{f_{\tilde{w}}(h+t v)-f_{\tilde{w}}(h)}{t}=2(\tilde{w}(h)-h, \tilde{w}(v)-\tilde{w}(0)-v) .
$$

If $\ell\left(\tilde{w}_{A^{\prime}}\right)=\ell\left(s \tilde{w}_{A} s\right)=\ell\left(\tilde{w}_{A}\right)+2$, then $D_{v} f_{\tilde{w}}(h)>0$.
2.2 Let $\operatorname{grad} f_{\tilde{w}}$ denote the gradient of the function $f_{\tilde{w}}$ on $V$; that is, for any other vector field $X$ on $V$, we have $X f_{\tilde{w}}=\left(X, \operatorname{grad} f_{\tilde{w}}\right)$. Here we naturally identify $V$ with the tangent space of any point in $V$.

We will describe where the gradient vanishes. To do this, we introduce an affine subspace $V_{\tilde{w}}$.

Notice that $\Omega$ is a finite subgroup of $\tilde{W}$. For any $\tilde{w} \in \tilde{W}$, there exists $n \in \mathbb{N}$ such that $\tilde{w}^{n} \in W$. Hence there exists $m \in \mathbb{N}$ such that $\tilde{w}^{m n}=t^{\lambda}$ for some $\lambda \in Q$. Set $\nu_{\tilde{w}}=\lambda / m n \in V$ and call it the Newton point of $\tilde{w}$. Then it is easy to see that $\nu_{\tilde{w}}$ does not depend on the choice of $m$ and $n$. We set

$$
V_{\tilde{w}}=\left\{v \in V ; \tilde{w}(v)=v+\nu_{\tilde{w}}\right\}
$$

Lemma 2.2. Let $\tilde{w} \in \tilde{W}$. Then $V_{\tilde{w}} \subset V$ is a nonempty affine subspace such that $V_{\tilde{w}}=\tilde{w} V_{\tilde{w}}=$ $V_{\tilde{w}}+\nu_{\tilde{w}}$.

Proof. Since $\tilde{w}$ is an affine transformation, for any $p \neq q \in V_{\tilde{w}}$, the affine line $L(p, q)$ is also contained in $V_{\tilde{w}}$. Thus $V_{\tilde{w}}$ is an affine subspace of $V$.

Now we prove that $V_{\tilde{w}}$ is nonempty. Assume $\tilde{w}^{n}=t^{n \nu_{\tilde{w}}}$ for some $n>0$. Let $q \in V$. Set $p=(1 / n) \sum_{i=0}^{n-1} \tilde{w}^{i}(q)$. Then $\tilde{w}(p)-p=(1 / n)\left(\tilde{w}^{n}(p)-p\right)=\nu_{\tilde{w}}$. In particular, $V_{\tilde{w}} \neq \emptyset$.

For any $x \in V_{\tilde{w}},\left\|\tilde{w}^{k}(x)-\tilde{w}^{k-1}(x)\right\|=\|\tilde{w}(x)-x\|=\left\|\nu_{\tilde{w}}\right\|$ and $\tilde{w}^{n}(x)-x=n \nu_{\tilde{w}}$. Hence $\tilde{w}^{k}(x)=\tilde{w}^{k-1}(x)+\nu_{\tilde{w}}$ for all $k \in \mathbb{Z}$. In particular, $\tilde{w}(x)=x+\nu_{\tilde{w}} \in V_{\tilde{w}}$.

## X. He and S. Nie

Lemma 2.3. Let $\tilde{w} \in \tilde{W}$. Then we have the following.
(1) For $v \in V, \operatorname{grad} f_{\tilde{w}}(v)=0$ if and only if $v \in V_{\tilde{w}}$.
(2) Let $C_{\tilde{w}}: V \times \mathbb{R} \rightarrow V$ denote the integral curve of the vector field $\operatorname{grad} f_{\tilde{w}}$ with $C_{\tilde{w}}(v, 0)=v$ for all $v \in V$. Define

$$
\operatorname{Lim}: V \rightarrow V_{\tilde{w}}, \quad v \mapsto \lim _{t \rightarrow-\infty} C_{\tilde{w}}(v, t) \in V_{\tilde{w}} .
$$

Then Lim : $V \rightarrow V_{\tilde{w}}$ is a trivial vector bundle over $V_{\tilde{w}}$.
Proof. (1) Let $p \in V_{\tilde{w}}$. Set $T_{p}: V \rightarrow V$ by $v \mapsto v+p$. Define $\tilde{w}_{p}=T_{p}^{-1} \circ \tilde{w} \circ T_{p}$ and $V_{\tilde{w}_{p}}=T_{p}^{-1} V_{\tilde{w}}=$ $\left\{v \in V ; \tilde{w}_{p}(v)=v+\nu_{\tilde{w}}\right\}$. Then $V_{\tilde{w}_{p}} \subset V$ is a linear subspace. Let $V_{\tilde{w}_{p}}^{\perp}=\left\{v \in V ;\left(v, V_{\tilde{w}_{p}}\right)=0\right\}$ be its orthogonal complement.

Then $\tilde{w}_{p}(x+y)=\tilde{w}_{p}(x)+\tilde{w}_{p}(y)-\tilde{w}_{p}(0)=x+\tilde{w}_{p}(y)$ for any $x \in V_{\tilde{w}_{p}}$ and $y \in V_{\tilde{w}_{p}}^{\perp}$. Since $\tilde{w}_{p}$ is an isometry on $V$, we have that

$$
\begin{aligned}
\|x\|^{2}+\|y\|^{2} & =\|x+y\|^{2}=\left\|\tilde{w}_{p}(x+y)-\tilde{w}_{p}(0)\right\|^{2} \\
& =\|x\|^{2}+\left\|\tilde{w}_{p}(y)-\tilde{w}_{p}(0)\right\|^{2}+2\left(x, \tilde{w}_{p}(y)-\tilde{w}_{p}(0)\right) .
\end{aligned}
$$

In particular, $\left(x, \tilde{w}_{p}(y)-\tilde{w}_{p}(0)\right)=0$ for all $x \in V_{\tilde{w}_{p}}$ and $y \in V_{\tilde{w}_{p}}^{\perp}$. Hence $\tilde{w}_{p}(y)-\tilde{w}_{p}(0) \in V_{\tilde{w}_{p}}^{\perp}$ for all $y \in V_{\tilde{w}_{p}}^{\perp}$. Let $M: V_{\tilde{w}_{p}}^{\perp} \rightarrow V_{\tilde{w}_{p}}^{\perp}$ be the linear transformation defined by $y \mapsto \tilde{w}_{p}(y)-\tilde{w}_{p}(0)-y$. By definition, ker $M \subset V_{\tilde{w}_{p}} \cap V_{\widehat{w}_{p}}^{\perp}=\{0\}$ for $\tilde{w}_{p}(0)=\nu_{\tilde{w}}$. Hence $M$ is invertible.

For $x \in V_{\tilde{w}_{p}}$ and $y \in V_{\widetilde{w}_{p}}^{\perp}$,

$$
\begin{aligned}
f_{\tilde{w}_{p}}(x+y) & =\left\|\tilde{w}_{p}(x+y)-(x+y)\right\|^{2}=\|M(y)\|^{2}+\left\|\tilde{w}_{p}(0)\right\|^{2} \\
& =\left(y,{ }^{t} M M(y)\right)+\left\|\nu_{\tilde{w}}\right\|^{2},
\end{aligned}
$$

where ${ }^{t} M$ is the transpose of $M$ with respect to the inner product $($,$) on V$. Thus $\operatorname{grad} f_{\tilde{w}_{p}}(x+y)=$ $2^{t} M M(y) \in V_{\tilde{w}_{p}}^{\perp}$. Hence $\operatorname{grad} f_{\tilde{w}_{p}}$ which vanishes exactly on $V_{\tilde{w}_{p}}$.

Notice that $f_{\tilde{w}_{p}}=f_{\tilde{w}} \circ T_{p}$ and $T_{p}$ is an isometry. We have that $\operatorname{grad} f_{\tilde{w}}(v)=\operatorname{grad} f_{\tilde{w}_{p}}(v-p)$ for any $v \in V$. Hence $\operatorname{grad} f_{\tilde{w}}$ vanishes exactly on $V_{\tilde{w}}$.
(2) The integral curve of $\operatorname{grad} f_{\tilde{w}_{p}}$ can be written explicitly as $C_{\tilde{w}_{p}}(x+y, t)=x+$ $\exp \left(2 t^{t} M M\right)(y)$ for any $x \in V_{\tilde{w}_{p}}$ and $y \in V_{\tilde{w}_{p}}^{\perp}$. Hence the integral curve $C_{\tilde{w}}(t, v)$ of $\operatorname{grad} f_{\tilde{w}}$ is given by $C_{\tilde{w}}(x+y, t)=x+\exp \left(2 t^{t} M M\right)(y)$ for $x \in V_{\tilde{w}}$ and $y \in V_{\tilde{w}_{p}}^{\perp}$. Since ${ }^{t} M M$ is self-adjoint with positive eigenvalues, $\lim _{t \rightarrow-\infty} \exp \left(2 t^{t} M M\right)=0$. Hence $\operatorname{Lim}(x+y)=x$ for any $x \in V_{\tilde{w}}$ and $y \in V_{\tilde{w}_{p}}^{\perp}$. Thus Lim is a trivial vector bundle over $V_{\tilde{w}}$.

Proposition 2.4. Let $\tilde{w} \in \tilde{W}$ and $A$ be an alcove. Then there exists an alcove $A^{\prime}$ such that $\bar{A}^{\prime}$ contains a regular point of $V_{\tilde{w}}$ and $\tilde{w}_{A} \rightarrow \tilde{w}_{A^{\prime}}$.
Remark 1. The proof is similar to [HN12, Proposition 1.2]. The difference is that we consider here $D_{\tilde{w}}=\left\{v \in V ; v \notin C_{\tilde{w}}\left(V^{\geqslant 2}, \mathbb{R}\right) \cup \operatorname{Lim}^{-1}\left(V_{\tilde{w}}^{\geqslant 1}\right)\right\}$, where $V_{\tilde{w}}^{\geqslant 1} \subset V_{\tilde{w}}$ is the complement of the set of regular points of $V_{\tilde{w}}$ and $V \geqslant 2$ be the complement of all alcoves and faces in $V$. We omit the details.
2.3 As a consequence, there exists a minimal length element in the conjugacy class of $\tilde{w}$ which is of the form $\tilde{w}_{A}$ for some alcove $A$ with $V_{\tilde{w}} \cap \bar{A} \neq \emptyset$. However, not every minimal length element is of this form. Now we give an example.

Let $W$ be the affine group of type $\tilde{A}_{2}$ with a set of simple reflections $\left\{s_{1}=s_{\alpha_{1}}, s_{2}=s_{\alpha_{2}}\right.$, $\left.s_{0}=t^{\alpha_{1}^{\vee}+\alpha_{2}^{\vee}} s_{1} s_{2} s_{1}\right\}$, where $\alpha_{1}, \alpha_{2}$ are the simple roots. The corresponding fundamental coweights

## Minimal length elements of extended affine Weyl groups

are denoted by $\omega_{1}^{\vee}, \omega_{2}^{\vee}$ respectively. Let $\delta \in \operatorname{Aut} W$ such that $\delta: s_{1} \mapsto s_{2}, s_{2} \mapsto s_{1}, s_{0} \mapsto s_{0}$. Let $\tilde{w}=t^{2 \alpha_{1}^{\vee}+2 \alpha_{2}^{\vee}} \delta$ and $A=t^{\alpha_{1}^{\vee}} s_{1} s_{2} \Delta$. Then $\ell(\tilde{w})=\ell\left(\tilde{w}_{A}\right)=8$ and $\tilde{w}_{A}$ is of minimal length in $W \cdot \tilde{w}$. Note that $V_{\tilde{w}}=\left\{v \in V ;\left(v, \alpha_{1}^{\vee}-\alpha_{2}^{\vee}\right)=0\right\}$. The vertices (extremal points) of $\bar{A}$ are $\omega_{1}^{\vee}, \omega_{1}^{\vee}-\omega_{2}^{\vee}$ and $2 \omega_{1}^{\vee}-\omega_{2}^{\vee}$ which all lie in the same connected component of $V-V_{\tilde{w}}$. Hence $V_{\tilde{w}} \cap \bar{A}=\emptyset$.
2.4 Now we recall the 'partial conjugation action' introduced in [He07].

For $J \subset S$, we denote by $W_{J}$ the standard parabolic subgroup of $W$ generated by $J$ and by ${ }^{J} \tilde{W}$ the set of minimal coset representatives in $W_{J} \backslash \tilde{W}$.

For $\tilde{w} \in{ }^{J} \tilde{W}$, set

$$
I(J, \tilde{w})=\max \{K \subset J ; \tilde{w}(K)=K\}
$$

The following result is proved in $[\mathrm{He} 07, \S 2$ and $\S 3]$. See also [He10, Theorem 2.1].
Theorem 2.5. Let $J \subset S$ such that $W_{J}$ is finite. We consider the (partial) conjugation action of $W_{J}$ on $\tilde{W}$. Let $\mathcal{O}$ be an orbit. Then we have the following:
(1) there exists $\tilde{w} \in{ }^{J} \tilde{W}$, such that for any $\tilde{w}^{\prime} \in \mathcal{O}$, there exists $x \in W_{I(J, \tilde{w})}$ such that $\tilde{w}^{\prime} \rightarrow x \tilde{w}$;
(2) if $\tilde{w}^{\prime}, \tilde{w}^{\prime \prime} \in \mathcal{O}_{\text {min }}$, then $\tilde{w}^{\prime} \sim \tilde{w}^{\prime \prime}$.
2.5 We will show that $\tilde{w}_{A^{\prime}}$ appeared in Proposition 2.4 is of the form $x y$ for some $y \in{ }^{J} \tilde{W}$ and $x \in W_{I(J, \tilde{w})}$. To do this, we introduce some more notation.

Let $K \subset V$ be a convex subset. Let $\mathfrak{H}_{K}=\{H \in \mathfrak{H} ; K \subset H\}$ and $W_{K} \subset W$ be the subgroup generated by $s_{H}$ with $H \in \mathfrak{H}_{K}$. For any two alcoves $A$ and $A^{\prime}$, define $\mathfrak{H}_{K}\left(A, A^{\prime}\right)=\mathfrak{H}\left(A, A^{\prime}\right) \cap \mathfrak{H}_{K}$.

Let $A$ be an alcove. We set $W_{K, A}=x_{A}^{-1} W_{K} x_{A}$ and $I(K, A)=\left\{s_{H} \in S ; K \subset x_{A} H\right\}$. If $\bar{A}$ contains a regular point of $K$, then $W_{K, A}=W_{I(K, A)}$.

Lemma 2.6. Let $\tilde{w} \in \tilde{W}$ and $K \subset V_{\tilde{w}}$ be an affine subspace with $\tilde{w}(K)=K$. Let $A$ be an alcove such that $A$ and $\tilde{w} A$ are in the same connected component $C$ of $V-\bigcup_{H \in \mathfrak{H}_{K}} H$. Assume furthermore that $\bar{A}$ contains an element $v \in K$ such that for each $H \in \mathfrak{H}, v, \tilde{w}(v) \in H$ implies that $K \subset H$. Then

$$
\ell\left(\tilde{w}_{A}\right)=\sharp \mathfrak{H}(A, \tilde{w} A)=\left\langle\bar{\nu}_{\tilde{w}}, 2 \rho\right\rangle .
$$

Here $\rho$ is the half sum of the positive roots in $\Phi$ and $\bar{\nu}_{\tilde{w}}$ is the unique dominant element in the $W_{0}$-orbit of $\nu_{\tilde{w}}$.

Proof. By our assumption, $\tilde{w}$ fixes $C$. Hence $\mathfrak{H}\left(\tilde{w}^{i} A, \tilde{w}^{j} A\right) \subset \mathfrak{H}-\mathfrak{H}_{K}$ for any $i, j \in \mathbb{Z}$. Since $v \in \bar{A}$ and $\tilde{w}(v) \in \tilde{w} \bar{A}$, any $H \in \mathfrak{H}(A, \tilde{w} A)$ intersects with the closed interval $[v, \tilde{w}(v)]$ at a single point.

If $\nu_{\tilde{w}}=0$, then $\tilde{w}(v)=v$. For any $H \in \mathfrak{H}(A, \tilde{w} A)$, we have $v \in H$, hence $H \in \mathfrak{H}_{K}$. That is a contradiction. Hence $\mathfrak{H}(A, \tilde{w} A)=\emptyset$ and $\ell\left(\tilde{w}_{A}\right)=\left\langle\bar{\nu}_{\tilde{w}}, 2 \rho\right\rangle=0$.

Now we assume $\nu_{\tilde{w}} \neq 0$. Set $v_{i}=\tilde{w}^{i}(v)=v+i \nu_{\tilde{w}} \in K$ for $i \in \mathbb{Z}$. Then all the $v_{i}$ span an affine line $L$. We prove the following.
(a) If $i<j$, then $\mathfrak{H}\left(\tilde{w}^{i-1} A, \tilde{w}^{i} A\right) \cap \mathfrak{H}\left(\tilde{w}^{j-1} A, \tilde{w}^{j} A\right)=\emptyset$.

Let $H \in \mathfrak{H}\left(\tilde{w}^{i-1} A, \tilde{w}^{i} A\right) \cap \mathfrak{H}\left(\tilde{w}^{j-1} A, \tilde{w}^{j} A\right)$. Then $H \cap L=H \cap\left[v_{i-1}, v_{i}\right] \cap\left[v_{j-1}, v_{j}\right] \neq \emptyset$. Thus $i=j-1$ and $v_{i} \in H$. Hence $H \in \mathfrak{H}\left(\tilde{w}^{i-1} A, \tilde{w}^{j} A\right)$. Therefore $\tilde{w}^{i} A$ and $\tilde{w}^{j} A$ are in the same connected component of $V-H$, that is, $H \notin \mathfrak{H}\left(\tilde{w}^{j-1} A, \tilde{w}^{j} A\right)$. Hence (a) is proved.

Now we prove the following.
(b) For $i<j, \mathfrak{H}\left(\tilde{w}^{i} A, \tilde{w}^{j} A\right)=\bigcup_{k=i+1}^{j} \mathfrak{H}\left(\tilde{w}^{k-1} A, \tilde{w}^{k} A\right)$.

If $H \notin \bigcup_{k=i+1}^{j} \mathfrak{H}\left(\tilde{w}^{k-1} A, \tilde{w}^{k} A\right)$, then $\tilde{w}^{i} A, \tilde{w}^{i+1} A, \ldots, \tilde{w}^{j} A$ are all in the same connected component of $V-H$. Thus $H \notin \mathfrak{H}\left(\tilde{w}^{i} A, \tilde{w}^{j} A\right)$.

Let $H \in \mathfrak{H}\left(\tilde{w}^{r-1} A, \tilde{w}^{r} A\right)$ for some $i<r \leqslant j$. Then $H \cap L=H \cap\left[v_{r-1}, v_{r}\right]=\{e\}$. If $e \notin\left\{v_{i}, v_{j}\right\}$, then $H \in \mathfrak{H}\left(\tilde{w}^{i} A, \tilde{w}^{j} A\right)$. If $e=v_{j}$, then $H \in \mathfrak{H}\left(\tilde{w}^{j-1} A, \tilde{w}^{j} A\right)$ and $v_{j-1}$ and $v_{i}$ are in the same connected component of $V-H$. Hence $\tilde{w}^{i} A$ and $\tilde{w}^{j-1} A$ are in the same connected component of $V-H$, while $\tilde{w}^{j-1} A$ and $\tilde{w}^{j} A$ are in different connected components of $V-H$. Hence $H \in \mathfrak{H}\left(\tilde{w}^{i} A\right.$, $\tilde{w}^{j} A$ ). If $e=v_{i}$, by a similar argument we have that $H \in \mathfrak{H}\left(\tilde{w}^{i} A, \tilde{w}^{j} A\right)$.

Let $n \in \mathbb{Z}$ such that $\tilde{w}^{n}=t^{n \nu \tilde{w}}$. Then by (a) and (b), we have that

$$
n \sharp \mathfrak{H}(A, \tilde{w} A)=\sum_{i=0}^{n-1} \sharp \mathfrak{H}\left(\tilde{w}^{i} A, \tilde{w}^{i+1} A\right)=\sharp \mathfrak{H}\left(A, \tilde{w}^{n} A\right)=\sharp \mathfrak{H}\left(A, t^{n \nu \bar{w}} A\right) .
$$

Hence $\ell\left(\tilde{w}_{A}\right)=\left\langle\bar{\nu}_{\tilde{w}}, 2 \rho\right\rangle$.
Proposition 2.7. Let $\tilde{w} \in \tilde{W}$ and $K \subset V_{\tilde{w}}$ be an affine subspace with $\tilde{w}(K)=K$. Let $A$ be an alcove such that $\bar{A}$ contains a regular point $v$ of $K$. Then $\tilde{w}_{A}=u \tilde{w}_{K, A}$ for some $u \in W_{I(K, A)}$ and $\tilde{w}_{K, A} \in{ }^{I(K, A)} \tilde{W}^{I(K, A)}$ with $\ell(u)=\sharp \mathfrak{H}_{K}(A, \tilde{w} A), \tilde{w}_{K, A}(I(K, A))=I(K, A)$ and $\ell\left(\tilde{w}_{K, A}\right)=$ $\left\langle\bar{\nu}_{\tilde{w}}, 2 \rho\right\rangle$.

Proof. We may assume that $A$ is the fundamental alcove $\Delta$ by replacing $\tilde{w}$ by $\tilde{w}_{A}$. We simply write $I$ for $I(K, \Delta)$.

We have that $\tilde{w}=u^{\prime} \tilde{w}^{\prime} u^{\prime \prime}$ for some $u^{\prime}, u^{\prime \prime} \in W_{I}$ and $\tilde{w}^{\prime} \in{ }^{I} \tilde{W}^{I}$. Since $\tilde{w} K=K$, then $\tilde{w}\left(\mathfrak{H}_{K}\right)=$ $\mathfrak{H}_{K}$ and $\tilde{w} W_{I} \tilde{w}^{-1}=W_{I}$. Hence $\tilde{w}^{\prime} W_{I}\left(\tilde{w}^{\prime}\right)^{-1}=W_{I}$ and $\tilde{w}^{\prime}(I)=I$.

Let $C$ be the connected component of $V-\bigcup_{H \in \mathfrak{H}_{K}} H$ that contains $\Delta$. We claim that $\tilde{w}^{\prime}(\Delta) \subset$ $C$. Otherwise, there exists $H \in \mathfrak{H}_{K}$ separating $\Delta$ and $\tilde{w}^{\prime}(\Delta)$. Hence $\ell\left(s_{H} \tilde{w}^{\prime}\right)<\ell\left(\tilde{w}^{\prime}\right)$. This contradicts our assumption that $\tilde{w}^{\prime} \in{ }^{I} \tilde{W}$. Hence $\ell(u)=\sharp \mathfrak{H}_{K}(\Delta, \tilde{w} \Delta)$ and $\mathfrak{H}_{K}\left(\Delta, \tilde{w}^{\prime}(\Delta)\right)=\emptyset$.

Since $W_{I}$ is a finite group and the conjugation by $\tilde{w}$ is a group automorphism on $W_{K}$, there exists $n>0$ such that

$$
\left(\tilde{w}^{\prime}\right)^{n} \tilde{w}^{-n}=u^{-1}\left(\tilde{w} u^{-1} \tilde{w}^{-1}\right) \cdots\left(\tilde{w}^{n-1} u^{-1} \tilde{w}^{-n+1}\right)=1 .
$$

Hence $\left(\tilde{w}^{\prime}\right)^{n}=\tilde{w}^{n}$ and there exists $m>0$ such that $m n \nu_{\tilde{w}} \in Q$ and $\left(\tilde{w}^{\prime}\right)^{m n}=\tilde{w}^{m n}=t^{m n \nu_{\tilde{w}}}$.
Note that $v$ and $\tilde{w}(v)=\tilde{w}^{\prime}(v)=v+\nu_{\tilde{w}}$ are regular points in $K$. Applying Lemma 2.6, we have $\ell\left(\tilde{w}^{\prime}\right)=\left\langle\bar{\nu}_{\tilde{w}^{\prime}}, 2 \rho\right\rangle=\left\langle\bar{\nu}_{\tilde{w}}, 2 \rho\right\rangle$.

Corollary 2.8. Let $\tilde{w} \in \tilde{W}$ be of minimal length in its conjugacy class. Then $\tilde{w}$ is of finite order if and only if $\tilde{w} \in W_{J} \rtimes\langle\delta\rangle$ for some proper subset $J$ of $S$ and $\delta \in \Omega$ with $\delta(J)=J$ such that the corresponding parabolic subgroup $W_{J}$ is finite.

Proof. The 'if' part is clear.
Now assume that $\tilde{w}$ is of finite order. Let $K=V_{\tilde{w}}$. By Proposition 2.4 and 2.7, there exists an alcove $A$ such that $\tilde{w} \approx \tilde{w}_{A}$ and $\tilde{w}_{A}=u \tilde{w}_{K, A}$ for some $u \in W_{I(K, A)}$ and $\tilde{w}_{K, A} \in{ }^{I(K, A)} W$ with $\tilde{w}_{K, A}(I(K, A))=I(K, A)$ and $\ell\left(\tilde{w}_{K, A}\right)=\left\langle\bar{\nu}_{\tilde{w}}, 2 \rho\right\rangle$. Since $\tilde{w}$ is of finite order, $\nu_{\tilde{w}}=0$ and $\ell\left(\tilde{w}_{K, A}\right)=0$. So $\tilde{w}_{K, A} \in \Omega$.

By definition, $I(K, A)$ is a subset of $S$ such that $W_{I(K, A)}$ is finite. We have that $\tilde{w}_{A} \in$ $W_{I(K, A)} \tilde{w}_{K, A}$ and $\tilde{w} \approx \tilde{w}_{A}$. Hence $\tilde{w} \in W_{I(K, A)} \tilde{w}_{K, A}$.

Now we may prove the main result of this section, generalizing $\S 0.1(1)$ and $\S 0.1(2)$ to affine Weyl groups.

## Minimal length elements of extended affine Weyl groups

Theorem 2.9. Let $\mathcal{O}$ be a $W$-conjugacy class in $\tilde{W}$ and $\mathcal{O}_{\min }$ be the set of minimal length elements in $\mathcal{O}$. Then we have the following:
(1) for each element $\tilde{w}^{\prime} \in \mathcal{O}$, there exists $\tilde{w}^{\prime \prime} \in \mathcal{O}_{\text {min }}$ such that $\tilde{w}^{\prime} \rightarrow \tilde{w}^{\prime \prime}$;
(2) let $\tilde{w}^{\prime}, \tilde{w}^{\prime \prime} \in \mathcal{O}_{\min }$, then $\tilde{w}^{\prime} \sim \tilde{w}^{\prime \prime}$.

Proof. (1) We fix an element $\tilde{w}$ of $\mathcal{O}$. Set $K=V_{\tilde{w}}$. Then any element in $\mathcal{O}$ is of the form $\tilde{w}_{A^{\prime}}$ for some alcove $A^{\prime}$. By Proposition 2.4, $\tilde{w}_{A^{\prime}} \rightarrow \tilde{w}_{A}$ for some alcove $A$ such that $\bar{A}$ contains a regular point of $K$.

If $C$ is a connected component of $V-\bigcup_{H \in \mathfrak{H}_{K}} H$, then $\tilde{w}(C)$ is also a connected component of $V-\bigcup_{H \in \mathfrak{H}_{K}} H$. We denote by $\ell(C)$ the number of hyperplanes in $\mathfrak{H}_{K}$ that separate $C$ and $\tilde{w}(C)$. By definition, if $C$ is the connected component that contains $A$, then $\ell(C)=\sharp \mathfrak{H}_{K}(A, \tilde{w} A)$. Now by Proposition 2.7, $\ell\left(\tilde{w}_{A}\right)=\ell(C)+\left\langle\bar{\nu}_{\tilde{w}}, 2 \rho\right\rangle$.

Let $C_{0}$ be a connected component of $V-\bigcup_{H \in \mathfrak{S}_{K}} H$ such that $\ell\left(C_{0}\right)$ is minimal among all the connected components of $V-\bigcup_{H \in \mathfrak{H}_{K}} H$. Then $\ell\left(\tilde{w}_{A^{\prime}}\right) \geqslant \ell\left(\tilde{w}_{A}\right) \geqslant \ell\left(C_{0}\right)+\left\langle\bar{\nu}_{\tilde{w}}, 2 \rho\right\rangle$. In particular, let $A_{0}$ be the alcove in $C_{0}$ such that $A_{0}=u A$ for some $u \in W_{K}$, then $\bar{A}_{0}$ contains a regular point of $K$ and $\tilde{w}_{A_{0}} \in \mathcal{O}_{\text {min }}$.

We have that $\tilde{w}_{A_{0}}=u^{\prime} \tilde{w}_{A}\left(u^{\prime}\right)^{-1}$ for some $u^{\prime} \in W_{K, A}$ and $\tilde{w}_{A_{0}}$ is a minimal length element in the $W_{K, A}$-conjugacy class $\mathcal{O}^{\prime}=\left\{x \tilde{w}_{A} x^{-1} ; x \in W_{K, A}\right\} \subset \mathcal{O}$. Hence, by Theorem 2.5, there exists $\tilde{w}^{\prime \prime} \in \mathcal{O}_{\min }^{\prime}$ such that $\tilde{w}_{A^{\prime}} \rightarrow \tilde{w}_{A} \rightarrow \tilde{w}^{\prime \prime} \sim \tilde{w}_{A_{0}}$. Since $\tilde{w}_{A_{0}} \in \mathcal{O}_{\min }, \tilde{w}^{\prime \prime} \in \mathcal{O}_{\min }$. Part (1) is proved.
(2) Let $\tilde{w}^{\prime} \in \mathcal{O}_{\text {min }}$. We have showed that there exists an alcove $A_{0}^{\prime} \subset C_{0}$ such that $\bar{A}_{0}^{\prime}$ contains a regular point of $K$ and $\tilde{w}^{\prime} \sim \tilde{w}_{A_{0}^{\prime}}$. Now it suffices to prove that $\tilde{w}_{A_{0}} \sim \tilde{w}_{A_{0}^{\prime}}$.

Let $\mathcal{A}_{C_{0}}$ be the set of all alcoves in $C_{0}$ whose closures contain regular points of $K$. Then $\bigcup_{A \in \mathcal{A}_{C_{0}}} \bar{A} \supset K$. Hence there exists a finite sequence of alcoves $A=A_{0}, \ldots, A_{r}=A_{0}^{\prime} \in \mathcal{A}_{C_{0}}$ such that $K_{i}=\bar{A}_{i} \cap \bar{A}_{i+1} \cap K \neq \emptyset$ for all $0 \leqslant i<r$. Then there exists $u_{i} \in W_{K_{i}}$ such that $A_{i+1}=u_{i} A_{i}$. Hence $\tilde{w}_{A_{i+1}}=u_{i}^{\prime} \tilde{w}_{A_{i}}\left(u_{i}^{\prime}\right)^{-1}$ for some $u_{i}^{\prime} \in W_{K_{i}, A_{i}}$. Notice that $\tilde{w}_{A_{i+1}}$ and $\tilde{w}_{A_{i}}$ are minimal length elements in $\left\{x \tilde{w}_{A_{i}} x^{-1} ; x \in W_{K_{i}, A_{i}}\right\}$. (Actually by the proof of (1), they are of minimal lengths in $\mathcal{O}$.) Thus by Theorem 2.5, $\tilde{w}_{A_{i+1}} \sim \tilde{w}_{A_{i}}$. Therefore $\tilde{w}_{A_{0}} \sim \tilde{w}_{A_{0}^{\prime}}$.

As a consequence, we have a similar result for any conjugacy class of $\tilde{W}$, which is a union of $W$-conjugacy classes.

Corollary 2.10. Let $\mathcal{O}$ be a conjugacy class of $\tilde{W}$ and $\mathcal{O}_{\min }$ be the set of minimal length elements in $\mathcal{O}$. Then we have the following:
(1) for each element $\tilde{w}^{\prime} \in \mathcal{O}$, there exists $\tilde{w}^{\prime \prime} \in \mathcal{O}_{\text {min }}$ such that $\tilde{w}^{\prime} \rightarrow \tilde{w}^{\prime \prime}$;
(2) let $\tilde{w}^{\prime}, \tilde{w}^{\prime \prime} \in \mathcal{O}_{\min }$, then $\tilde{w}^{\prime} \tilde{\sim} \tilde{w}^{\prime \prime}$.

## 3. Straight conjugacy class

3.1 Following [Kra09], we call an element $\tilde{w} \in \tilde{W}$ a straight element if, for any $m \in \mathbb{N}, \ell\left(\tilde{w}^{m}\right)=$ $m \ell(\tilde{w})$. We call a conjugacy class straight if it contains some straight element. It is easy to see that $\tilde{w}$ is straight if and only if $\ell(\tilde{w})=\left\langle\bar{\nu}_{\tilde{w}}, 2 \rho\right\rangle$ (see [He10]).

By definition, any basic element of $\tilde{W}$ is straight. Also $t^{\lambda}$ is also straight with $\lambda \in Q$. In Proposition 3.1, we will give some nontrivial examples of straight elements.
3.2 We follow [Spr74, 7.3]. Let $\delta \in \Omega$. For each $\delta$-orbit in $S$, we pick a simple reflection. Let $g$ be the product of these simple reflections (in any order) and put $c=(g, \delta) \in W \rtimes\langle\delta\rangle$. We call

## X. He and S. Nie

$c$ a twisted Coxeter element of $\tilde{W}$. The following result will be used in forthcoming work by He and Wedhorn in the study of basic locus of Shimura varieties.
Proposition 3.1. Let $c$ be a twisted Coxeter element of $\tilde{W}$. Then $c$ is a straight element.
Remark 2. The case where $\delta=1$ (for any Coxeter group of infinite order) was first obtained by Speyer in [Spe09]. Our method here is different from that given by Speyer.

Proof. Assume that $c \in W \delta$ for $\delta \in \Omega$. By Propositions 2.4 and 2.7, $c \rightarrow u x$ for some $I \subset S$ with $W_{I}$ finite, $u \in W_{I}$, and a straight element $x$ with $x(I)=I$. It is easy to see that $u x$ is also a twisted Coxeter element and $c \approx u x$. In particular, $x=w \delta$ for some $w \in W_{S-I}$. For any $s \in I$, $w \delta(s) w^{-1} \in I$. Hence $\delta(s) \in I$ and commutes with $w$. So $\delta(I)=I$ and $\delta(S-I)=S-I$. Since $u x$ is a twisted Coxeter element of $\tilde{W}, x=w \delta$ is a twisted Coxeter element of $W_{S-I} \rtimes\langle\delta\rangle$. On the other hand, $w$ commutes with any element in $I$. Thus $I$ is a union of connected components of the Dynkin diagram of $S$. Hence $I=\emptyset$ since $W_{I}$ is finite. So $u=1$ and $c \approx x$ is also a straight element.
3.3 We will give some algebraic and geometric criteria for straight conjugacy classes. In order to do this, we first make a short digression and discuss another description of $\tilde{W}$.

Let $G$ be a connected complex reductive algebraic group and $T \subset G$ be a maximal torus of $G$. Let $W_{0}$ be the finite Weyl group of $G$ and $S_{0}$ the set of simple roots. We denote by $Q$ (respectively $P$ ) the coroot lattice (respectively coweight lattice) of $T$ in $G$. Then $W_{G}=Q \rtimes W_{0}$ is an affine Weyl group in 1.3. Set $\tilde{W}_{G}=P \rtimes W_{0}$. For the group $\Omega^{\prime}$ of diagram automorphisms of $S_{0}$ that induces an action on $G$, we set $\tilde{W}_{G, \Omega^{\prime}}=\tilde{W}_{G} \rtimes \Omega^{\prime}$. Then $\tilde{W}_{G, \Omega^{\prime}}=W_{G} \rtimes \Omega$ for some $\Omega \subset \operatorname{Aut}\left(W_{G}, S\right)$ with $\Omega(S)=S$. It is easy to check that for any affine Weyl group $W$, $W \rtimes \operatorname{Aut}(W, S)=\tilde{W}_{G, \Omega^{\prime}}$. Here $G$ is the corresponding semisimple group of adjoint type and $\Omega^{\prime}$ is the group of diagram automorphisms on $S_{0}$.

For any $J \subset S_{0}$, set $\Omega_{J}^{\prime}=\left\{\delta \in \Omega^{\prime} ; \delta(J)=J\right\}$ and

$$
\tilde{W}_{J}=\left(P \rtimes W_{J}\right) \rtimes \Omega_{J}^{\prime} .
$$

We call an element in $\tilde{W}_{J}$ basic if it is of length 0 with respect to the length function on $\tilde{W}_{J}$.
In the rest of this section, we assume that $W=W_{G}$ and $\tilde{W}=\tilde{W}_{G, \Omega^{\prime}}$ unless otherwise stated.
Proposition 3.2. Let $\mathcal{O}$ be a $W_{G}$-conjugacy class of $\tilde{W}$. Then the following conditions are equivalent:
(1) $\mathcal{O}$ is straight;
(2) for some (or, equivalently, any) $\tilde{w} \in \mathcal{O}, V_{\tilde{w}} \nsubseteq H$ for any $H \in \mathfrak{H}$;
(3) $\mathcal{O}$ contains a basic element of $\tilde{W}_{J}$ for some $J \subset S_{0}$.

In this case, there exist a basic element $x$ in $\tilde{W}_{J_{\mathcal{O}}}$ and $y \in W_{0}^{J_{\mathcal{O}}}$ such that $\nu_{x}=\nu_{\mathcal{O}}$ and $y x y^{-1} \in \mathcal{O}_{\min }$. Here $\nu_{\mathcal{O}}=\bar{\nu}_{\tilde{w}}$ for some (or, equivalently, any) $\tilde{w} \in \mathcal{O}$ and $J_{\mathcal{O}}=\left\{i \in S_{0} ;\right.$ $\left.\left\langle\nu_{\mathcal{O}}, \alpha_{i}\right\rangle=0\right\}$.

Proof. (1) $\Leftrightarrow$ (2). By Proposition 2.4 and Proposition 2.7, there is an alcove $A$ such that $\bar{A}$ contains a regular point of $V_{\tilde{w}}$ and $\tilde{w}_{A} \in \mathcal{O}_{\text {min }}$. Moreover $\ell\left(\tilde{w}_{A}\right)=\left\langle\bar{\nu}_{\tilde{w}}, 2 \rho\right\rangle+\sharp \mathfrak{H}_{V_{\tilde{w}}}(A, \tilde{w} A)$.

If $\mathfrak{H}_{V_{\tilde{w}}}=\emptyset$, then $\mathfrak{H}_{V_{\tilde{w}}}(A, \tilde{w} A)=\emptyset$. Hence $\ell\left(\tilde{w}_{A}\right)=\left\langle\bar{\nu}_{\tilde{w}}, 2 \rho\right\rangle$ and $\tilde{w}_{A} \in \mathcal{O}$ is a straight element.
If $\mathcal{O}$ is straight, then $\sharp \mathfrak{H}_{V_{\tilde{w}}}(A, \tilde{w} A)=0$, that is, $\tilde{w}$ fixes the connected component $C$ of $V-\bigcup_{H \in \mathfrak{H}_{\tilde{w}}} H$ containing $A$. Choose $v \in C$ and set $y=(1 / n) \sum_{k=0}^{n-1} \tilde{w}^{k}(v)$, where $n \in \mathbb{N}$ with $\tilde{w}^{n}=t^{n \nu_{\tilde{w}}}$. Since $C$ is convex, we have $y \in C \cap V_{\tilde{w}}$, which forces $\mathfrak{H}_{V_{\tilde{w}}}$ to be empty.

## Minimal length elements of extended affine Weyl groups

$(3) \Rightarrow(2)$. Denote by $\Phi_{J} \subset \Phi$ the set of roots spanned by $\alpha_{i}$ for $i \in J$. Assume $\tilde{w}=t^{\chi} w \delta^{\prime} \in \mathcal{O}$ is a basic element in $\tilde{W}_{J}$. Then it is a straight element in $\tilde{W}_{J}$. By condition (2) for $\tilde{W}_{J}, V_{\tilde{w}} \nsubseteq H_{\alpha, k}$ for any $\alpha \in \Phi_{J}$ and $k \in \mathbb{Z}$.

Let $\mu \in V$ with

$$
\left\langle\mu, \alpha_{i}\right\rangle= \begin{cases}0 & \text { if } i \in J \\ 1 & \text { if } i \in S_{0}-J\end{cases}
$$

Since $\delta^{\prime}(J)=J$, then $\delta^{\prime}(\mu)=\mu$. Hence $w \delta^{\prime}(\mu)=\mu$ and $\mathbb{R} \mu+V_{\tilde{w}}=V_{\tilde{w}}$. Therefore $\left\langle V_{\tilde{w}}, \alpha\right\rangle=\mathbb{R}$ for any $\alpha \in \Phi-\Phi_{J}$. Thus $V_{\tilde{w}} \nsubseteq H_{\alpha, k} \in \mathfrak{H}$ with $\alpha \in \Phi-\Phi_{J}$ and $k \in \mathbb{Z}$.
$(1) \Rightarrow(3)$. By Proposition 2.7 and condition (2) there exists $\tilde{w} \in \mathcal{O}_{\text {min }}$ such that $\Delta$ contains a regular point $e$ of $V_{\tilde{w}}$. Let $y \in W_{0}^{J_{\mathcal{O}}}$ with $\nu_{\mathcal{O}}=y^{-1}\left(\nu_{\tilde{w}}\right)$. Set $x=y^{-1} \tilde{w} y$. Then $\nu_{x}=\nu_{\mathcal{O}}$ is dominant.

Assume that $x=t^{\chi} w \delta^{\prime} \in \mathcal{O}$ with $\chi \in P, w \in W_{0}$ and $\delta^{\prime} \in \Omega^{\prime}$. Let $n \in \mathbb{N}$ with $x^{n}=t^{n \nu_{O}}$. Then

$$
t^{n \nu_{\mathcal{O}}+\chi} w \delta^{\prime}=t^{n \nu_{\mathcal{O}}} x=x t^{n \nu_{\mathcal{O}}}=t^{w \delta^{\prime}\left(\nu_{\mathcal{O}}\right)+\chi} w \delta^{\prime}
$$

Thus $\nu_{\mathcal{O}}=w \delta^{\prime}\left(\nu_{\mathcal{O}}\right)$ is the unique dominant element in $W_{0} \cdot \delta^{\prime}\left(\nu_{\mathcal{O}}\right)$. Hence $\delta^{\prime}\left(\nu_{\mathcal{O}}\right)=\nu_{\mathcal{O}}$ and $w \nu_{\mathcal{O}}=\nu_{\mathcal{O}}$. Therefore $w \in W_{J_{\mathcal{O}}}$ and $\delta^{\prime}\left(J_{\mathcal{O}}\right)=J_{\mathcal{O}}$. Hence $x \in \tilde{W}_{J_{\mathcal{O}}}$.

Let $C$ be the connected component of $V-\bigcup_{k} \bigcup_{\alpha \in \Phi_{J}} H_{\alpha, k}$ that contains $\Delta$. Since $y \in W_{0}^{J \mathcal{O}}$, for any $\alpha \in \Phi_{J_{\mathcal{O}}}^{+}, y \alpha \in \Phi^{+}$and $0<\left(y^{-1}(e), \alpha\right)=(e, y(\alpha))<1$. Hence $y^{-1}(e) \in C$. Moreover,

$$
x y^{-1}(e)=y^{-1} \tilde{w}(e)=y^{-1}\left(e+\nu_{\tilde{w}}\right)=y^{-1}(e)+\nu_{\mathcal{O}} .
$$

Since $\left\langle\nu_{\mathcal{O}}, \alpha\right\rangle=0$ for all $\alpha \in \Phi_{J}$, we have $y^{-1}(e)$ and $y^{-1}(e)+\nu_{\mathcal{O}}$ are contained in the same connected component of $V-\bigcup_{k} \bigcup_{\alpha \in \Phi_{J}} H_{\alpha, k}$. Hence $C \ni y^{-1}(e)$ and $x C \ni x y^{-1}(e)$ are the same connected component of $V-\bigcup_{k} \bigcup_{\alpha \in \Phi_{J}} H_{\alpha, k}$. Thus there is no hyperplane of the form $H_{\alpha, k}$ with $\alpha \in \Phi_{J}$ that separates $C$ from $x C$. So $x$ is a basic element in $\tilde{W}_{J}$.
3.4 The next task of this section is to give a parametrization of straight conjugacy classes. Such parametrization coincides with the set of $\sigma$-conjugacy classes of $p$-adic groups [He14].

Let $P^{+}$be the set of dominant coweights of $G$ and

$$
P_{\mathbb{Q}}^{+}=\left\{\lambda \in P \otimes_{\mathbb{Z}} \mathbb{Q} ;\langle\lambda, \alpha\rangle \geqslant 0 \text { for all } \alpha \in \Phi^{+}\right\} \subset V .
$$

Then we may identify $P_{\mathbb{Q}}^{+}$with $\left(P \otimes_{\mathbb{Z}} \mathbb{Q}\right) / W_{0}$. For any $\lambda \in P \otimes_{\mathbb{Z}} \mathbb{Q}$, we denote by $\bar{\lambda}$ the unique element in $P_{\mathbb{Q}}^{+}$that lies in the $W_{0}$-orbit of $\lambda$. The group $\Omega^{\prime}$ acts naturally on $P_{\mathbb{Q}}^{+}$and on $\tilde{W}_{G} / W_{G} \cong P / Q$. Let $\delta^{\prime} \in \Omega^{\prime}$.

For $x \in \tilde{W}_{G} \delta^{\prime}$, we call $\bar{\nu}_{x}$ the dominant Newton point of $x$. The map $x \mapsto\left(x \delta^{\prime-1} W_{G}, \bar{\nu}_{x}\right)$ induces a natural map

$$
f_{\delta^{\prime}}: \tilde{W}_{G} \delta^{\prime} \rightarrow(P / Q)_{\delta^{\prime}} \times P_{\mathbb{Q}}^{+} .
$$

Here $\tilde{W}_{G} \delta^{\prime} \in \tilde{W}_{G} \backslash \tilde{W}$ is a right $\tilde{W}_{G^{\prime}}$-coset containing $\delta^{\prime}$ and $(P / Q)_{\delta^{\prime}}$ is the $\delta^{\prime}$-coinvariants of $P / Q$. We denote the image by $B\left(\tilde{W}_{G}, \delta^{\prime}\right)$.
Theorem 3.3. The map $f_{\delta^{\prime}}$ induces a bijection between the straight $\tilde{W}_{G}$-conjugacy classes of $\tilde{W}_{G} \delta^{\prime}$ and $B\left(\tilde{W}_{G}, \delta^{\prime}\right)$.

Proof. We first show that the following holds.
(a) The map $f_{\delta^{\prime}}$ is constant on each $\tilde{W}_{G^{-}}$-conjugacy class.

## X. He and S. Nie

Let $\tilde{w}=t^{\chi} w \delta^{\prime} \in \tilde{W}$ and $\tilde{u}=t^{\lambda} u \in \tilde{W}_{G}$, where $\chi, \lambda \in P$ and $w, u \in W_{0}$. Then $\tilde{u} \tilde{w} \tilde{u}^{-1}=$
 $t^{\lambda+u \chi-\left(u w \delta^{\prime} u^{-1}\left(\delta^{\prime}\right)^{-1}\right) \delta^{\prime} \lambda} \in t^{\lambda+\chi-\delta^{\prime}(\lambda)} W_{G}$ and

$$
\tilde{u} \tilde{w} \tilde{u}^{-1} \in t^{\lambda+\chi-\delta^{\prime}(\lambda)} W_{G}\left(u w \delta^{\prime} u^{\prime}\left(\delta^{\prime}\right)^{-1}\right) \delta^{\prime}=t^{\lambda+u-\delta^{\prime}(\lambda)} \delta^{\prime} W_{G} .
$$

Hence the images of $\tilde{u} \tilde{w} \tilde{u}^{-1}$ and $\tilde{w}$ in $(P / Q)_{\delta^{\prime}}$ are the same. Assume that $n \in \mathbb{N}$ and $\tilde{w}^{n}=t^{n \nu_{\tilde{w}}}$. Then $\left(\tilde{u} \tilde{w} \tilde{u}^{-1}\right)^{n}=\tilde{u} t^{n \nu \tilde{w}} \tilde{u}^{-1}=t^{\lambda} t^{u n \nu_{\tilde{w}}} t^{-\lambda}=t^{u n \nu_{\tilde{w}}}$. Therefore $\nu_{\tilde{u} \tilde{w} \tilde{u}-1}=u\left(\nu_{\tilde{w}}\right)$ and $\bar{\nu}_{\tilde{u} \tilde{w} \tilde{u}}{ }^{-1}=\bar{\nu}_{\tilde{w}}$.

Result (a) is proved.
Moreover, $t^{n \nu_{\tilde{w}}}=\tilde{w} t^{n \nu_{\tilde{w}}} \tilde{w}^{-1}=t^{\chi} t^{w n \delta^{\prime}\left(\nu_{\tilde{w}}\right)} t^{-\chi}=t^{w n \delta^{\prime}\left(\nu_{\tilde{w}}\right)}$. Thus $\nu_{\tilde{w}}=w \delta^{\prime}\left(\nu_{\tilde{w}}\right)$. Hence:
(b) $\bar{\nu}_{\tilde{w}}=\delta^{\prime}\left(\bar{\nu}_{\tilde{w}}\right)$ for all $\tilde{w} \in \tilde{W}_{G} \delta^{\prime}$.

By Proposition 2.4 and 2.7, for any $\tilde{w} \in \tilde{W}, \tilde{w} \rightarrow u \tilde{w}_{I}$ for some $I \subset S$ with $W_{I}$ finite, $u \in W_{I}$, and a straight element $\tilde{w}_{I}$ with $\tilde{w}_{I}(I)=I$. By the proof of [He10, Proposition 2.2], $f_{\delta^{\prime}}(\tilde{w})=f_{\delta^{\prime}}\left(u \tilde{w}_{I}\right)=f_{\delta^{\prime}}\left(\tilde{w}_{I}\right)$. So $f_{\delta^{\prime}}$ is surjective.

Now we prove that $f_{\delta^{\prime}}$ is injective.
Let $\tilde{w}, \tilde{w}^{\prime} \in \tilde{W}_{G} \delta^{\prime}$ with $f_{\delta^{\prime}}(\tilde{w})=f_{\delta^{\prime}}\left(\tilde{w}^{\prime}\right)$. Assume $\tilde{w}=t^{\lambda} w \delta^{\prime}$ and $\tilde{w}^{\prime}=t^{\lambda^{\prime}} w^{\prime} \delta^{\prime}$ for some $\lambda, \lambda^{\prime} \in P, w, w^{\prime} \in W_{G}$. Then after conjugating by a suitable element of $\tilde{W}_{G}$, we can assume further that $\tilde{w} W_{G}=\tilde{w}^{\prime} W_{G}$.

Let $J=\left\{i \in S_{0} ;\left\langle\bar{\nu}_{\tilde{w}}, \alpha_{i}\right\rangle=0\right\}$. By (b), $\bar{\nu}_{\tilde{w}}=\delta^{\prime}\left(\bar{\nu}_{\tilde{w}}\right)$. Then $\delta^{\prime}(J)=J$. By Proposition 3.2, after conjugating by some elements in $W_{G}$, we may assume that $\tilde{w}, \tilde{w}^{\prime} \in \tilde{W}_{J}$ and $\nu=\nu_{\tilde{w}}=\nu_{\tilde{w}^{\prime}} \in P_{\mathbb{Q}}^{+}$.

Let $J^{\prime}=S_{0}-J$ and $Q_{J}, Q_{J^{\prime}}$ be the sublattices of $Q$ spanned by simple roots of $J$ and $J^{\prime}$ respectively. Then

$$
V=P \otimes_{\mathbb{Z}} \mathbb{R}=Q_{J} \otimes_{\mathbb{Z}} \mathbb{R} \oplus Q_{J^{\prime}} \otimes_{\mathbb{Z}} \mathbb{R}
$$

We may write $\lambda$ and $\lambda^{\prime}$ as $\lambda=a_{J}+a_{J^{\prime}}$ and $\lambda^{\prime}=a_{J}^{\prime}+a_{J^{\prime}}^{\prime}$ with $a_{J}, a_{J}^{\prime} \in Q_{J} \otimes_{\mathbb{Z}} \mathbb{R}$ and $a_{J^{\prime}}, a_{J^{\prime}}^{\prime} \in Q_{J^{\prime}} \otimes_{\mathbb{Z}} \mathbb{R}$. Since $\lambda-\lambda^{\prime} \in Q$, then $a_{J}-a_{J}^{\prime} \in Q_{J}$ and $a_{J^{\prime}}-a_{J^{\prime}}^{\prime} \in Q_{J^{\prime}}$.

Choose $n \in \mathbb{N}$ such that $\left(w \delta^{\prime}\right)^{n}=\left(w^{\prime} \delta^{\prime}\right)^{n}=1$. Then

$$
\nu=\frac{1}{n} \sum_{k=0}^{n-1}\left(w \delta^{\prime}\right)^{k}(\lambda) \in \frac{1}{n} \sum_{k=0}^{n-1}\left(\delta^{\prime}\right)^{k}\left(a_{J^{\prime}}\right)+Q_{J} \otimes_{\mathbb{Z}} \mathbb{Q} .
$$

Similarly,

$$
\nu \in \frac{1}{n} \sum_{k=0}^{n-1}\left(\delta^{\prime}\right)^{k}\left(a_{J^{\prime}}^{\prime}\right)+Q_{J} \otimes_{\mathbb{Z}} \mathbb{Q} .
$$

Hence

$$
\sum_{k=0}^{n-1}\left(\delta^{\prime}\right)^{k}\left(a_{J^{\prime}}-a_{J^{\prime}}^{\prime}\right)=0
$$

Since $a_{J^{\prime}}-a_{J^{\prime}}^{\prime} \in Q_{J^{\prime}}$, then $a_{J^{\prime}}-a_{J^{\prime}}^{\prime}=\theta-\delta^{\prime}(\theta)$ for some $\theta \in Q_{J^{\prime}}$. Let $\tilde{w}^{\prime \prime}=t^{\theta} \tilde{w}^{\prime} t^{-\theta}$. By condition (2) of Theorem 3.2, $\tilde{w}^{\prime}$ and $\tilde{w}^{\prime \prime}$ are conjugate to basic elements in $\tilde{W}_{J}$ by elements in $Q_{J} \rtimes W_{J}$. Moreover, $\lambda \in \lambda^{\prime}+\theta-\delta^{\prime}(\theta)+Q_{J}$ and $\left(Q_{J} \rtimes W_{J}\right) \tilde{w}=\left(Q_{J} \rtimes W_{J}\right) \tilde{w}^{\prime \prime} \in\left(Q_{J} \rtimes W_{J}\right) \backslash \tilde{W}_{J}$. Thus $\tilde{w}$ and $\tilde{w}^{\prime \prime}$ are conjugate to the same basic element of $\tilde{W}_{J}$ by an element in $Q_{J} \rtimes W_{J}$ and $\tilde{w}$ and $\tilde{w}^{\prime}$ are in the same $\tilde{W}_{G}$-conjugacy class.

Combining Proposition 2.4, Proposition 2.7 and the proof of Theorem 2.9, any $\tilde{W}_{G}$-conjugacy class of $\tilde{W}_{G} \delta^{\prime}$ can be 'reduced' to the unique straight conjugacy class in the same fiber of $f_{\delta^{\prime}}$ as follows.

## Minimal length elements of extended affine Weyl groups

Theorem 3.4. Let $\mathcal{O}$ be a $\tilde{W}_{G}$-conjugacy class of $\tilde{W}_{G} \delta^{\prime}$ and $\tilde{w} \in \mathcal{O}$. Then there exists $\tilde{w}^{\prime} \in \mathcal{O}_{\min }$ such that the following hold:
(1) $\tilde{w} \rightarrow \tilde{w}^{\prime}$;
(2) there exists a straight element $x \in \tilde{W}_{G} \delta^{\prime}$ with $f_{\delta^{\prime}}(x)=f_{\delta^{\prime}}(\tilde{w})$, a subset $J$ of $S$ with $W_{J}$ finite, $x \in{ }^{J}\left(\tilde{W}_{G} \delta^{\prime}\right)$ and $x^{-1}(J)=J$, and an element $u \in W_{J}$ such that $\tilde{w}^{\prime}=u x$.
3.5 Let $\tau \in \Omega$. Conjugation by $\tau$ gives a permutation on the set of affine simple reflections $S$ of $W$. We say that $\tau$ is superbasic if each orbit is a union of connected components of the Dynkin diagram of $S$.

In this case, any two vertices in the same connected components of $S$ have the same numbers of edges and thus $S$ is a union of affine Dynkin diagrams of type $\tilde{A}$. Hence it is easy to see that $\tau \in \Omega$ is a superbasic element of $\tilde{W}$ if and only if $W=W_{1}^{m_{1}} \times \cdots \times W_{l}^{m_{l}}$, where $W_{i}$ is an affine Weyl group of type $\tilde{A}_{n_{i}-1}$ and $\tau$ gives an order $n_{i} m_{i}$ permutation on $W_{i}^{m_{i}}$.
3.6 We follow the notation in $\S 3.4$. Let $\delta^{\prime} \in \Omega^{\prime}$. Then any fiber of the map $f_{\delta^{\prime}}: \tilde{W}_{G} \delta^{\prime} \rightarrow(P / Q)_{\delta^{\prime}} \times$ $P_{\mathbb{Q}}^{+}$is a union of $\tilde{W}_{G}$-conjugacy classes. We call a $\tilde{W}_{G}$-conjugacy class in $\tilde{W}_{G} \delta^{\prime}$ superstraight if it is a fiber of $f_{\delta^{\prime}}$. By Theorem 3.3, any fiber contains a straight $\tilde{W}_{G^{-}}$-conjugacy class. Hence a superstraight conjugacy class is in particular straight. Now we give a description of superstraight $\tilde{W}_{G}$-conjugacy classes which is analogous to Proposition 3.2.

Proposition 3.5. We keep the notation as in $\S 3.3$. Let $\mathcal{O}$ be a $\tilde{W}_{G}$-conjugacy class of $\tilde{W}$. Then the following are equivalent:
(1) The conjugacy class $\mathcal{O}$ is superstraight;
(2) for some (or, equivalently, any) $\tilde{w} \in \mathcal{O}, H \cap V_{\tilde{w}}=\emptyset$ for any $H \in \mathfrak{H}\left(\nu_{\tilde{w}}\right)$. Here $H \in \mathfrak{H}\left(\nu_{\tilde{w}}\right)=$ $\left\{H_{\alpha, k} \in \mathfrak{H} ;\left\langle\nu_{\tilde{w}}, \alpha\right\rangle=0, k \in \mathbb{Z}\right\} ;$
(3) there exists a superbasic element $x$ in $\tilde{W}_{J_{\mathcal{O}}}$ and $y \in W_{G}^{J_{\mathcal{O}}}$ such that $\nu_{x}=\nu_{\mathcal{O}}$ and $y x y^{-1} \in$ $\mathcal{O}_{\text {min }}$.
Proof. We assume that $\mathcal{O} \subset \tilde{W}_{G} \delta^{\prime}$ for some $\delta^{\prime} \in \Omega^{\prime}$.
$(1) \Rightarrow(3)$. By Proposition 3.2, there exists a basic element $x$ in $\tilde{W}_{J_{\mathcal{O}}}$ and $y \in W_{G}^{J_{\mathcal{O}}}$ such that $\nu_{x}=\nu_{\mathcal{O}}$ and $y x y^{-1} \in \mathcal{O}_{\text {min }}$. Assume that $x$ is not superbasic in $\tilde{W}_{J_{\mathcal{O}}}$. Then there exists an $x$-orbit $O$ such that $C \cap O \subsetneq C$ for each connected component $C$ of the Dynkin diagram $\tilde{W}_{J_{\mathcal{O}}}$.

Note that $C \cap O \subsetneq C$ is the Dynkin diagram of a finite Weyl group. Hence $W_{O}$ is a finite product of Weyl groups corresponding to $C \cap O$ and hence is finite. By the proof of [He10, Proposition 2.2], $f_{\delta^{\prime}}(w x)=f_{\delta^{\prime}}(x)$ for all $w \in W_{O}$. In particular, $s_{j} x$ and $x$ are in the same fiber of $f_{\delta^{\prime}}$ for any $j \in O$.

However, $\ell\left(s_{j} x\right) \equiv \ell(x)+1 \bmod 2$. Thus $s_{j} x$ and $x$ are not in the same conjugacy class. So $\mathcal{O}$ is not superstraight.
(2) $\Rightarrow$ (1). Note that $H \in \mathfrak{H}\left(\nu_{\tilde{w}}\right)$ if $V_{\tilde{w}} \subset H \in \mathfrak{H}$. Hence, by Proposition 3.2 (2), $\mathcal{O}$ is straight. Let $\mathcal{O}^{\prime}$ be another $\tilde{W}_{G}$-conjugacy class such that $\mathcal{O}^{\prime}$ and $\mathcal{O}$ are in the same fiber of $f_{\delta^{\prime}}$. By Proposition 2.4 and Proposition 2.7, $\mathcal{O}^{\prime}$ contains an element of the form $u x$, where $x$ is straight, $f_{\delta^{\prime}}(u x)=f_{\delta^{\prime}}(x)$ and $u \in W_{V_{u x}}$. By Theorem 3.3, $x \in \mathcal{O}$. By the proof of [He10, Proposition 2.2], $\nu_{u x}=\nu_{x}$.

Let $v \in V_{u x}$. By Lemma 2.2, $u x(v)=v+\nu_{u x}=v+\nu_{x} \in V_{u x}$. Since $u \in W_{V_{u x}}, x(v)=$ $u^{-1} u x(v)=u x(v)=v+\nu_{x}$ and $v \in V_{x}$. Thus $V_{u x} \subset V_{x}$.

## X. He and S. Nie

Let $H \in \mathfrak{H}_{V_{u x}} \subset \mathfrak{H}\left(\nu_{x}\right)$. Then, by our assumption, $H \cap V_{u x} \subset H \cap V_{x}=\emptyset$, which forces $\mathfrak{H}_{V_{u x}}=\emptyset$. Hence $W_{V_{u x}}=\{1\}$ and $u=1$. So $\mathcal{O}^{\prime}=\mathcal{O}$.
$(3) \Rightarrow(2)$. Let $C$ be the unique connected component of $V-\bigcup_{H \in \mathfrak{H}\left(\nu_{\mathcal{O}}\right)} H$ containing $\Delta$. We call $H \in \mathfrak{H}\left(\nu_{\mathcal{O}}\right)$ a wall of $C$ if $H \cap \bar{C}$ spans $H$. Let $\mathfrak{H}(C)$ be the set of walls of $C$. Note that $x C=C$ for $x$ is basic. Since $C$ is convex, $V_{x} \cap C \neq \emptyset$.

Suppose that $V_{x} \cap H^{\prime} \neq \emptyset$ for some $H^{\prime} \in \mathfrak{H}\left(\nu_{\mathcal{O}}\right)$. Let $p \in V_{x} \cap H^{\prime}$ and $q \in V_{x} \cap C$. Then the affine line $L(p, q) \subset V_{x}$ intersects with the boundary $\partial \bar{C} \subset \bigcup_{H \in \mathfrak{H}(C)} H$ of $\bar{C}$. Choose $v \in$ $L(p, q) \cap \partial \bar{C}$. Then $v \in H_{0}$ for some $H_{0} \in \mathfrak{H}(C)$. Thus $x^{m}(v)=v+m \nu_{\mathcal{O}} \in x^{m} H_{0}$ for $m \in \mathbb{Z}$. Notice that $\mathbb{R} \nu_{\mathcal{O}}+H=H$ for all $H \in \mathfrak{H}\left(\nu_{\mathcal{O}}\right)$. Thus $v \in x^{m} H_{0}$ for all $m \in \mathbb{Z}$. As $x$ is superbasic, the orbit $O=\left\{x^{i} H_{0} ; i \in \mathbb{Z}\right\}$ is a union of connected components of the Dynkin diagram of $\left\{s_{H} ; H \in \mathfrak{H}(C)\right\}$. Hence $v \in \bigcap_{H \in O} H=\emptyset$. That is a contradiction.
3.7 In the rest of this section, we will show that any two straight elements in the same conjugacy class are conjugate by cyclic shift, which is analogous to $\S 0.1(3)$ for an elliptic conjugacy class of a finite Coxeter group.

In order to do this, we use the following length formula. The proof is similar to [HN12, Proposition 2.3] and is omitted here.

Proposition 3.6. Let $\tilde{w} \in \tilde{W}$ and $K \subset V_{\tilde{w}}$ be an affine subspace with $\tilde{w}(K)=K$. Let $A$ and $A^{\prime}$ be two alcoves in the same connected component of $V-\bigcup_{H \in \mathfrak{H}_{K}} H$. Assume that $\bar{A} \cap \bar{A}^{\prime} \cap K$ spans a codimension 1 subspace of $K$ of the form $H_{0} \cap K$ for some $H_{0} \in \mathfrak{H}$ and $\tilde{w}\left(H_{0} \cap K\right) \neq H_{0} \cap K$. Then

$$
\ell\left(\tilde{w}_{A}\right)=\ell\left(\tilde{w}_{A^{\prime}}\right)=\left\langle\bar{\nu}_{\tilde{w}}, 2 \rho\right\rangle+\sharp \mathfrak{H}_{K}(A, \tilde{w} A) .
$$

Lemma 3.7. Let $\tilde{w} \in \tilde{W}$. Let $K \subset V_{\tilde{w}}$ be an affine subspace such that $\tilde{w} K=K$. Let $A$ and $A^{\prime}$ be two alcoves such that $\bar{A} \cap \bar{A}^{\prime}$ contains a regular point of $K$ and $\tilde{w}_{A}, \tilde{w}_{A^{\prime}}$ are straight elements. Then $\tilde{w}_{A}=\tilde{w}_{A^{\prime}}$.

Proof. We may assume that $A$ is the fundamental alcove $\Delta$ by replacing $\tilde{w}$ by $\tilde{w}_{A}$. We simply write $I$ for $I(K, \Delta)$. By Proposition 2.7 and the straightness of $\tilde{w}, \tilde{w} \in{ }^{I} \tilde{W}^{I}$ and $\tilde{w}(I)=I$. Since $\bar{A}^{\prime} \cap \bar{\Delta}$ contains a regular point of $K, x_{A^{\prime}} \in W_{I}$. Thus

$$
\tilde{w}_{A^{\prime}}=x_{A^{\prime}}^{-1} \tilde{w} x_{A^{\prime}}=\left(x_{A^{\prime}}^{-1} \tilde{w} x_{A^{\prime}} \tilde{w}^{-1}\right) \tilde{w}
$$

and $x_{A^{\prime}}^{-1} \tilde{w} x_{A^{\prime}} \tilde{w}^{-1} \in W_{I}$. Therefore $\ell\left(\tilde{w}_{A^{\prime}}\right)=\ell(\tilde{w})+\ell\left(x_{A^{\prime}}^{-1} \tilde{w} x_{A^{\prime}} \tilde{w}^{-1}\right)$. Since $\ell\left(\tilde{w}_{A^{\prime}}\right)=\ell(\tilde{w})$, we have $x_{A^{\prime}}^{-1} \tilde{w} x_{A^{\prime}} \tilde{w}^{-1}=1$ and $\tilde{w}_{A^{\prime}}=\tilde{w}$.

Theorem 3.8. Let $\mathcal{O}$ be a straight $W$-conjugacy class of $\tilde{W}$. Then for any $\tilde{w}, \tilde{w}^{\prime} \in \mathcal{O}_{\min }, \tilde{w} \approx \tilde{w}^{\prime}$.
Proof. Let $\tilde{u} \in \mathcal{O}$ and $K=V_{\tilde{u}}$. Then by Proposition 2.4 and Proposition 2.7, we may assume that $\tilde{w}=\tilde{u}_{A}$ and $\tilde{w}^{\prime}=\tilde{u}_{A^{\prime}}$, where $A$ and $A^{\prime}$ are two alcoves whose closures contain regular points of $K$. Let $C$ be the connected component of $V-\bigcup_{H \in \mathfrak{H}_{K}} H$ that contains $A$ and let $A^{\prime \prime}$ be the unique alcove in $C$ such that $\bar{A}^{\prime} \cap \bar{A}^{\prime \prime}$ contains a regular point of $K$. By Proposition 2.7, we have $\tilde{u}_{A^{\prime \prime}} \in \mathcal{O}_{\text {min }}$. By Lemma 3.7, we have that $\tilde{u}_{A^{\prime}}=\tilde{u}_{A^{\prime \prime}}$.

It remains to show that $\tilde{u}_{A} \approx \tilde{u}_{A^{\prime \prime}}$. Assume $A \neq A^{\prime \prime}$. Similar to the proof of [HN12, Lemma 2.4], there is a sequence of alcoves $A=A_{0}, A_{1}, \ldots, A_{r}=A^{\prime \prime}$ in $C$ such that $A_{i}$ contains a regular point of $K$ and $\bar{A}_{i-1} \cap \bar{A}_{i} \cap K$ spans a codimension one affine subspace $P_{i}$ of $K$ for $i=1,2, \ldots, r$. By Proposition 2.7, $\tilde{u}_{A_{i}} \in \mathcal{O}_{\text {min }}$ for any $i$.

If $\tilde{u} P_{i}=P_{i}$, by Lemma 3.7, we have that $\tilde{u}_{A_{i-1}}=\tilde{u}_{A_{i}}$. If $\tilde{u}\left(P_{i}\right) \neq P_{i}$, then there is a sequence of alcoves $A_{i-1}=B_{0}, B_{1}, \ldots, B_{s}=A_{i}$ in $C$ such that $B_{k-1}$ and $B_{k}$ share a common face

## Minimal Length elements of extended affine Weyl groups

and $\bar{B}_{k-1} \cap \bar{B}_{k} \cap K$ spans $P_{i}$ for $k=1, \ldots, s$. By Proposition 3.6, we have that $\ell\left(\tilde{u}_{B_{k-1}}\right)=\ell\left(\tilde{u}_{B_{k}}\right)$ and $\tilde{u}_{B_{k-1}} \approx \tilde{u}_{B_{k}}$ for $k=1, \ldots, s$. So $\tilde{u}_{A_{i-1}} \approx \tilde{u}_{A_{i}}$. Hence $\tilde{u}_{A} \approx \tilde{u}_{A^{\prime \prime}}$.

## 4. Centralizer in $W$

4.1 Let $(W, S)$ be a Coxeter group and $\Omega$ be a group with a group homomorphism to $\operatorname{Aut}(W, S)$. Let $\tilde{W}=W \rtimes \Omega$. Let $\tilde{w} \in \tilde{W}$ be a minimal length element in its conjugacy class. Let $\mathcal{P}_{\tilde{w}}$ be the set of sequences $\mathbf{i}=\left(s_{1}, \ldots, s_{r}\right)$ of $S$ such that

$$
\tilde{w} \xrightarrow{s_{1}} s_{1} \tilde{w} s_{1} \xrightarrow{s_{2}} \cdots \xrightarrow{s_{r}} s_{r} \cdots s_{1} \tilde{w} s_{1} \cdots s_{r} .
$$

We call such sequence a path form $\tilde{w}$ to $s_{r} \cdots s_{1} \tilde{w} s_{1} \cdots s_{r}$. Denote by $\mathcal{P}_{\tilde{w}, \tilde{w}}$ the set of all paths from $\tilde{w}$ to itself. Let $W_{\tilde{w}}=\left\{x \in W ; \ell\left(x^{-1} \tilde{w} x\right)=\ell(\tilde{w})\right\}$ and $Z(\tilde{w})=\{x \in W ; x \tilde{w}=\tilde{w} x\}$.

There is a natural map

$$
\tau_{\tilde{w}}: \mathcal{P}_{\tilde{w}} \rightarrow W_{\tilde{w}},\left(s_{1}, \ldots, s_{r}\right) \mapsto s_{1} \cdots s_{r},
$$

which induces a natural map $\tau_{\tilde{w}, \tilde{w}}: \mathcal{P}_{\tilde{w}, \tilde{w}} \rightarrow Z(\tilde{w})$.
We call a $W$-conjugacy class $\mathcal{O}$ of $\tilde{W}$ nice if, for some (or, equivalently, any) $\tilde{w} \in \mathcal{O}_{\text {min }}$, the $\operatorname{map} \tau_{\tilde{w}}: \mathcal{P}_{\tilde{w}} \rightarrow W_{\tilde{w}}$ is surjective. It is easy to see that $\mathcal{O}$ is nice if and only if properties (1) and (2) below hold for $\mathcal{O}$ :
(1) for any $\tilde{w}, \tilde{w}^{\prime} \in \mathcal{O}_{\min }, \tilde{w} \approx \tilde{w}^{\prime}$;
(2) for any $\tilde{w} \in \mathcal{O}_{\min }$, the map $\tau_{\tilde{w}, \tilde{w}}: \mathcal{P}_{\tilde{w}, \tilde{w}} \rightarrow Z(\tilde{w})$ is surjective.

The definition of nice conjugacy classes is inspired by a conjecture of Lusztig [Lus11b, 1.2] that property (2) holds for elliptic conjugacy classes of a finite Weyl group.
4.2 For finite Weyl groups, nice conjugacy classes play an important role in the study of DeligneLusztig varieties and representations of finite groups of Lie type. Property §4.1(1) is a key ingredient to prove that Deligne-Lusztig varieties corresponding to minimal length elements in a nice conjugacy class are universally homeomorphic. Property $\S 4.1(2)$ leads to nontrivial (quasi-)automorphisms on Deligne-Lusztig varieties and their cohomology groups. For more details, see [DM06] and [Lus11b].

Nice conjugacy classes for affine Weyl groups will also play an important role in the study of affine Deligne-Lusztig varieties. See [He14].
4.3 The main goal of this section is to classify nice conjugacy classes for both finite Coxeter groups and affine Weyl groups.

We first consider finite Coxeter groups. Let $\left(W_{0}, S_{0}\right)$ be a finite Coxeter group and $\Omega^{\prime} \subset$ $\operatorname{Aut}\left(W_{0}, S_{0}\right)$. Set $\tilde{W}_{0}=W_{0} \rtimes \Omega^{\prime}$. Let $z=w \sigma \in \tilde{W}_{0}$ with $w \in W_{0}$ and $\sigma \in \Omega^{\prime}$. We denote by $\operatorname{supp}(w)$ the support of $w$, i.e. the set of simple reflections appearing in a reduced expression of $w$. Set $\operatorname{supp}(z)=\bigcup_{n \in \mathbb{Z}} \sigma^{n} \operatorname{supp}(w)$. We call $\operatorname{supp}(z)$ the support of $z$. It is a $\sigma$-stable subset of $S_{0}$.

We call a $W_{0}$-conjugacy class $\mathcal{O}$ of $\tilde{W}_{0}$ elliptic if $\operatorname{supp}(\tilde{w})=S_{0}$ for any $\tilde{w} \in \mathcal{O}$. An element in an elliptic conjugacy class is called an elliptic element.

We have the following result.
Theorem 4.1. Any elliptic conjugacy class in a finite Coxeter group is nice.

## X. He and S. Nie

4.4 In order to classify nice conjugacy classes for finite Coxeter group, we first recall the geometric interpretation of conjugacy classes and length function in [HN12].

Let $V$ be a finite-dimensional Euclidean vector space over $\mathbb{R}$ and $\mathfrak{H}_{0}$ be a finite set of hyperspaces of $V$ through the origin such that $s_{H}\left(\mathfrak{H}_{0}\right)=\mathfrak{H}_{0}$ for all $H \in \mathfrak{H}_{0}$. Let $W_{0} \subset \mathrm{GL}(V)$ be the subgroup generated by $s_{H}$ for $H \in \mathfrak{H}_{0}$. Let $\mathfrak{C}\left(\mathfrak{H}_{0}\right)$ be the set of connected components of $V-\bigcup_{H \in \mathfrak{H}_{0}} H$. We call an element in $\mathfrak{C}\left(\mathfrak{H}_{0}\right)$ a chamber. We fix a fundamental chamber $C_{0}$. For any two chambers $C, C^{\prime}$, we denote by $\mathfrak{H}_{0}\left(C, C^{\prime}\right)$ the set of hyperspaces in $\mathfrak{H}_{0}$ separating $C$ from $C^{\prime}$. Let $S_{0}=\left\{s_{H} \in W_{0} ; \sharp \mathfrak{H}_{0}\left(C_{0}, s_{H} C_{0}\right)=1\right\}$. Then ( $W_{0}, S_{0}$ ) is a finite Coxeter group. Let $\tilde{W}_{0}=W_{0} \rtimes \Omega^{\prime}$ where $\Omega^{\prime} \subset \mathrm{GL}(V)$ consists of automorphism preserving $S_{0}$. Then $\ell(w)=\sharp \mathfrak{H}_{0}\left(C_{0}\right.$, $w C_{0}$ ) is the length function on $\tilde{W}_{0}$.

It is known that $W_{0}$ acts simply transitively on the set of chambers. For any chamber $C$, we denote by $x_{C}$ the unique element in $W_{0}$ with $x_{C} C_{0}=C$. Here $C_{0}$ is the fundamental chamber. Then any element in the $W_{0}$-conjugacy class of $\tilde{w}$ is of the form $\tilde{w}_{C}=x_{C}^{-1} \tilde{w} x_{C}$ for some chamber $C$.

For any $\tilde{w} \in \tilde{W}_{0}$, we denote by $\mathfrak{C}_{\tilde{w}}\left(\mathfrak{H}_{0}\right)$ the set of chambers $C$ such that $\tilde{w}_{C}$ is of minimal length in its $W_{0}$-conjugacy class. We denote by $V_{\mathfrak{H}_{0}}^{\text {subreg }}$ the set of points in $V$ that is contained in at most one hyperplane of $\mathfrak{H}_{0}$. By [HN12, Lemma 4.1], we have the following.
(a) A $W_{0}$-conjugacy class $\mathcal{O}$ of $\tilde{W}_{0}$ is nice if and only if $\left(\bigcup_{A \in \mathfrak{C}_{\tilde{w}}\left(\mathfrak{H}_{0}\right)} \bar{A}\right) \bigcap V_{\mathfrak{H}_{0}}^{\text {subreg }}$ is connected for some (or, equivalently, any) $\tilde{w} \in \mathcal{O}$.

By [ He 07 , Lemma 7.2$]$, a $W_{0}$-conjugacy class $\mathcal{O}$ of $\tilde{W}_{0}$ is elliptic if and only if, for some (or, equivalently, any) element $\tilde{w} \in \mathcal{O}$, the fixed point set $V^{\tilde{w}} \subset V^{W_{0}}$. Now we introduce the weakly elliptic conjugacy classes.
Proposition 4.2. Let $\mathcal{O}$ be a $W_{0}$-conjugacy class of $\tilde{W}_{0}$. Then the following conditions are equivalent.
(1) For some $\tilde{w} \in \mathcal{O}_{\min }, \operatorname{supp}(\tilde{w})$ is a union of some connected components of the Dynkin diagram of $S_{0}$ and $\tilde{w}$ commutes with any element in $S_{0}-\operatorname{supp}(\tilde{w})$.
(2) For any $\tilde{w} \in \mathcal{O}, \operatorname{supp}(\tilde{w})$ is a union of some connected components of the Dynkin diagram of $S_{0}$ and $\tilde{w}$ commutes with any element in $S_{0}-\operatorname{supp}(\tilde{w})$.
(3) For some (or, equivalently, any) element $\tilde{w} \in \mathcal{O}, s_{H} V^{\tilde{w}}=V^{\tilde{w}}$ for all $H \in \mathfrak{H}_{0}$.

In this case, we call $\mathcal{O}$ a weakly elliptic conjugacy class and any element in $\mathcal{O}$ a weakly elliptic element.

Proof. (1) $\Rightarrow(2)$. Assume that $\mathcal{O} \subset W_{0} \sigma$ for $\sigma \in \Omega^{\prime}$. By our assumption, $\sigma(s)=s$ for all $s \in S_{0}-S_{0}^{\prime}$ and $\operatorname{supp}\left(x \tilde{w} x^{-1}\right) \subset S_{0}^{\prime}$ for any $x \in W_{0}$. Since $\tilde{w}$ is elliptic in $W_{S_{0}^{\prime}} \rtimes\langle\sigma\rangle$, then $\operatorname{supp}\left(x \tilde{w} x^{-1}\right)=S_{0}^{\prime}$ for any $x \in W_{0}$.
$(2) \Rightarrow(3)$. Assume that $\mathcal{O} \subset W_{0} \sigma$ for some $\sigma \in \Omega^{\prime}$. By assumption, there exists $S_{0}^{\prime} \subset S_{0}$, which is a union of some connected components of the Dynkin diagram of $S_{0}$ such that $\sigma(s)=s$ for all $s \in S_{0}-S_{0}^{\prime}$ and $\operatorname{supp}(\tilde{w})=S_{0}^{\prime}$ for any $\tilde{w} \in \mathcal{O}$. Then $\mathcal{O}$ is elliptic in $W_{S_{0}^{\prime}} \rtimes\langle\sigma\rangle$. Therefore $V^{\tilde{w}} \subset V^{W_{S_{0}^{\prime}}}$ for all $\tilde{w} \in \mathcal{O}$. Hence $s_{H} V^{\tilde{w}}=V^{\tilde{w}}$ for all $H \in \mathfrak{H}_{0}$.
$(3) \Rightarrow(1)$. By [HN12, Proposition 2.2], there exists $\tilde{w} \in \mathcal{O}_{\text {min }}$ such that $\bar{C}_{0}$ contains a regular point $e$ of $V^{\tilde{w}}$. Assume that $\tilde{w}=w \sigma$ for $w \in W_{0}$ and $\sigma \in \Omega^{\prime}$. Then $w \sigma(e)=e$ and thus $e=$ $\sigma(e)=w(e)$ for $e, \sigma(e) \in \bar{C}_{0}$ are dominant.

Let $J=\left\{s \in S_{0} ; s(e)=e\right\}$. Then $\sigma(J)=J$ and $w \in W_{J}$. Note that $V^{\tilde{w}} \subset V^{W_{J}}$ for $e$ is a regular element in $V^{\tilde{w}}$. Hence $\tilde{w}$ is an elliptic element in $W_{J} \rtimes\langle\sigma\rangle$ and $\operatorname{supp}(\tilde{w})=J$.

## Minimal length elements of extended affine Weyl groups

Let $s \in S_{0}-J$. Then $s\left(V^{\tilde{w}}\right)=V^{\tilde{w}}$. Thus $s(e)=e+\langle e, \alpha\rangle \alpha^{\vee} \in V^{\tilde{w}}$, where $\alpha$ is the positive root corresponding to $s$. Since $s \notin J$, we have $s(e) \neq e$ and $\alpha^{\vee} \in V^{\tilde{w}}$. Hence $\tilde{w} s=s \tilde{w}$. The statement follows from the following Lemma 4.3.

Lemma 4.3. Let $\tilde{w}=w \sigma$ with $w \in W_{0}$ and $\sigma \in \Omega^{\prime}$. Let $s \in S_{0}-\operatorname{supp}(\tilde{w})$. Then $s \tilde{w}=\tilde{w} s$ if and only if $s=\sigma(s)$ and $s$ commutes with each element of $\operatorname{supp}(\tilde{w})$.

Proof. Let $K=\operatorname{supp}(w)$ and $K^{\prime}=\left\{s^{\prime} \in K ; s s^{\prime}=s^{\prime} s\right\}$. Write $w$ as $w=a b c$ for $a \in W_{K^{\prime}}$, $c \in W_{\sigma\left(K^{\prime}\right)}$ and $b \in K^{K^{\prime}} W_{0}{ }^{\sigma\left(K^{\prime}\right)}$. Then $s b=b \sigma(s)$. Since $s \notin K$ and each element of $K-K^{\prime}$ does not commute with $s$, we have that $b \sigma(s)=s b \in{ }^{K-K^{\prime}} W_{0}$. Therefore $b \in{ }^{K-K^{\prime}} W_{K}$ for $\sigma(s) \notin K$. Since $b \in{ }^{K^{\prime}} W_{K}$, we must have that $b=1$. Hence $s=\sigma(s)$ and $K=\operatorname{supp}(a) \cup \operatorname{supp}(c) \subset K^{\prime}$. Hence for any $n \in \mathbb{Z}$ and any $r \in K, s \sigma^{n}(r)=\sigma^{n}(s r)=\sigma^{n}(r s)=\sigma^{n}(r) s$. Therefore $s$ commutes with every element of $\operatorname{supp}(\tilde{w})=\bigcup_{n \in \mathbb{Z}} \sigma^{n}(K)$.

Now we classify nice conjugacy classes for $\tilde{W}_{0}$.
Theorem 4.4. Let $\mathcal{O}$ be a $W_{0}$-conjugacy class of $\tilde{W}_{0}$. Then $\mathcal{O}$ is nice if and only if it is weakly elliptic.

Proof. Suppose that $\mathcal{O}$ is nice. Let $\tilde{w} \in \mathcal{O}_{\text {min }}$ and $S_{0}^{\prime}=\operatorname{supp}(\tilde{w})$. Then $w_{0} \tilde{w} w_{0} \in \mathcal{O}_{\min }$, where $w_{0}$ is the largest element of $W_{0}$. Hence there exists a reduced expression $w_{0}=s_{1} s_{2} \ldots s_{r}$ such that $\tilde{w}_{0} \approx \tilde{w}_{1} \approx \cdots \approx \tilde{w}_{r}$, where $\tilde{w}_{i}=\left(s_{1} \ldots s_{i}\right)^{-1} \tilde{w}\left(s_{1} \ldots s_{i}\right)$. By [He07, Lemma 7.4], $\operatorname{supp}\left(\tilde{w}_{i}\right)=$ $\operatorname{supp}(\tilde{w})=S_{0}^{\prime}$ for all $i$. Therefore $s_{j+1} \tilde{w}_{j} s_{j+1}=\tilde{w}_{j}$ if $s_{j+1} \notin S_{0}^{\prime}$. By Lemma 4.3, st $=t s$ and $\tilde{w} t=t \tilde{w}$ for any $s \in S_{0}^{\prime}$ and any $t \in S_{0}-S_{0}^{\prime}$. Hence $\mathcal{O}$ is weakly elliptic.

Suppose that $\mathcal{O}$ is weakly elliptic. Let $\tilde{w} \in \mathcal{O}_{\text {min }}$ and $J=\operatorname{supp}(\tilde{w})$. Let $x \in W_{0}$ such that $\ell\left(x^{-1} \tilde{w} x\right)=\ell(\tilde{w})$. We may write $x$ as $x_{2} x_{1}$ with some $x_{1} \in W_{J}$ and $x_{2} \in W_{S_{0}-J}$ for $J$ and $S_{0}-J$ are unions of connected components of the Dynkin diagram of $S_{0}$ and $\tilde{w}$. Then $x^{-1} \tilde{w} x=$ $x_{1}^{-1}\left(x_{2}^{-1} \tilde{w} x_{2}\right) x_{1}=x_{1}^{-1} \tilde{w} x_{1}$. Since $\tilde{w}$ commutes with each simple reflection of $S_{0}-J, x_{2}$ is in the image of $\tau_{\tilde{w}}$. By assumption, $\tilde{w}$ is elliptic in $W_{J} \rtimes\langle\sigma\rangle$ for some $\sigma \in \Omega^{\prime}$. Thus by [HN12, Corollary 4.4], $x_{1}$ is in the image of $\tau_{\tilde{w}}$. Hence so is $x_{2} x_{1}$. Thus $\mathcal{O}$ is nice.
4.5 Now we study affine Weyl groups. We keep the notation as in $\S 3.3$. Let $\tilde{W}_{0}=W_{0} \rtimes \Omega^{\prime}$. Then $\tilde{W}=W_{G} \rtimes \Omega=P \rtimes \tilde{W}_{0}$. For any $\tilde{w} \in \tilde{W}$, we denote by $\mathfrak{A}_{\tilde{w}}$ the set of alcoves $A$ such that $\tilde{w}_{A}$ is of minimal length in its $W$-conjugacy class. We denote by $V^{\text {subreg }}$ the set of points in $V$ that is contained in at most one hyperplane of $\mathfrak{H}$. Similar to the proof of [HN12, Lemma 4.1], we have.
(a) A $W$-conjugacy class $\mathcal{O}$ of $\tilde{W}$ is nice if and only if $\left(\bigcup_{A \in \mathfrak{A}_{\tilde{w}}} \bar{A}\right) \cap V^{\text {subreg }}$ is connected for some (or, equivalently, any) $\tilde{w} \in \mathcal{O}$.
4.6 Let $y \in \tilde{W}$. Let $K \subset V_{y}$ be an affine subspace such that $y K=K$. Choose $p \in K$. Define $\bar{y}=T_{-\nu_{y}-p} \circ y \circ T_{p} \in \mathrm{GL}(V)$, where $T_{v}$ denotes the map of translation by $v \in V$. Then $\bar{y}(0)=0$ and $\bar{y}$ is the image of $y$ under the map $\tilde{W}=P \rtimes \tilde{W}_{0} \rightarrow \tilde{W}_{0}$. In other words, $\bar{y}$ is the finite part of $y$.

Set $\mathfrak{H}_{K, p}=T_{-p}\left(\mathfrak{H}_{K}\right)$. Then any element in $\mathfrak{H}_{V_{y, p}}$ is a hyperplane through 0 and contains $V^{\bar{y}}=T_{-p}\left(V_{y}\right)$. Since $y$ preserves $\mathfrak{H}_{K}, \bar{y}$ preserves $\mathfrak{H}_{K, p}$.

The following result relates §4.4(a) with §4.5(a).
Lemma 4.5. Keep the notation as above. Assume $p$ is a regular point of $K$ and $A, A^{\prime} \in \mathfrak{A}_{y}$ with $p \in \bar{A} \cap \bar{A}^{\prime}$. Let $C$ (respectively $C^{\prime}$ ) be the unique element of $\mathfrak{C}\left(\mathfrak{H}_{K, p}\right)$ such that $A \subset T_{p}(C)$

## X. He and S. Nie

(respectively $A \subset T_{p}\left(C^{\prime}\right)$ ). Then $A$ and $A^{\prime}$ are in the same connected component of $\left(\bigcup_{A \in \mathfrak{A}_{y}} \bar{A}\right) \cap$ $V^{\text {subreg }}$ if and only if $C$ and $C^{\prime}$ are in the same connected component of $\left(\bigcup_{C \in \mathfrak{C}_{\bar{y}}\left(\mathfrak{H}_{K, p}\right)} \bar{C}\right) \cap V_{\mathfrak{H}_{K, p}}^{\text {subreg }}$. Proof. Suppose that $C$ and $C^{\prime}$ are in the same connected component of $\left(\bigcup_{C \in \mathcal{C}_{\bar{y}}\left(\mathfrak{H}_{K, p}\right)} \bar{C}\right) \cap V_{\mathfrak{H}_{K, p}}^{\text {subreg }}$. Then there is a sequence $C=C_{1}, C_{2}, \ldots, C_{t}=C^{\prime}$ in $\mathfrak{C}_{\bar{y}}\left(\mathfrak{H}_{K, p}\right)$ such that $\bar{C}_{i} \cap \bar{C}_{i+1}$ spans $H_{i}^{\prime} \in \mathfrak{H}_{K, p}$ for $i=0, \ldots, t-1$. Note that all the numbers $\sharp \mathfrak{H}_{K, p}\left(C_{i}, \bar{y} C_{i}\right)$ are the same. Let $A_{i}$ be the unique alcove in $T_{p}\left(C_{i}\right)$ whose closure contains $p$. Then $\bar{A}_{i} \cap \bar{A}_{i+1}$ spans $T_{p}\left(H_{i}^{\prime}\right) \in \mathfrak{H}_{K}$ for each $i$. By Proposition 2.7,

$$
\begin{aligned}
\sharp \mathfrak{H}\left(A_{i}, y A_{i}\right) & =\sharp \mathfrak{H}_{K}\left(A_{i}, y A_{i}\right)+\left\langle\bar{\nu}_{y}, 2 \rho\right\rangle=\sharp \mathfrak{H}_{K, p}\left(C_{i}, \bar{y} C_{i}\right)+\left\langle\bar{\nu}_{y}, 2 \rho\right\rangle \\
& =\sharp \mathfrak{H}(A, y A) .
\end{aligned}
$$

Hence all the $A_{i}$ lie in the same connected component of $\left(\bigcup_{A \in \mathfrak{A}_{y}} \bar{A}\right) \cap V^{\text {subreg }}$.
Suppose that $A$ and $A^{\prime}$ are in the same connected component of $\left(\bigcup_{A \in \mathcal{A}_{y}} \bar{A}\right) \cap V^{\text {subreg. There }}$ is a sequence of alcoves $A=A_{1}, A_{2}, \ldots, A_{r}=A^{\prime}$ in $\mathfrak{A}_{y}$ such that $A_{i}$ and $A_{i+1}$ share a common face which spans $H_{i} \in \mathfrak{H}$ for all $i$. By Proposition 2.7, $C, C^{\prime} \in \mathfrak{C}_{\bar{y}}\left(\mathfrak{H}_{K, p}\right)$. Now we define a sequence of chambers in $\mathfrak{C}_{\bar{y}}\left(\mathfrak{H}_{K, p}\right)$ as follows. Let $C_{1}=C$. Assume that $C_{i}$ is already defined for $i \geqslant 1$. Let $j_{i}=\max \left\{k ; T_{-p}\left(A_{k}\right) \subset C_{i}\right\}$. Let $C_{i+1}$ be the unique connected component containing $T_{-p}\left(A_{j_{i}+1}\right)$. We obtain a sequence $C=C_{1}, \ldots, C_{s}=C^{\prime}$ in this way.

Notice that $H_{j_{i}} \in \mathfrak{H}_{K}$ (hence so is $y H_{j_{i}}$ ) and

$$
\mathfrak{H}\left(A_{j_{i}}, y A_{j_{i}}\right)-\left\{H_{j_{i}}, y H_{j_{i}}\right\} \subset \mathfrak{H}\left(A_{j_{i}+1}, y A_{j_{i}+1}\right) \subset \mathfrak{H}\left(A_{j_{i}}, y A_{j_{i}}\right) \cup\left\{H_{j_{i}}, y H_{j_{i}}\right\} .
$$

Since $\sharp \mathfrak{H}\left(A_{j_{i}}, y A_{j_{i}}\right)=\sharp \mathfrak{H}\left(A_{j_{i}+1}, y A_{j_{i}+1}\right)$, then $\left\{H_{j_{i}}, y H_{j_{i}}\right\} \cap \mathfrak{H}\left(A_{j_{i}+1}, y A_{j_{i}+1}\right)$ consists of at most one element. Hence

$$
\left\{T_{-p}\left(H_{j_{i}}\right), T_{-p}\left(y H_{j_{i}}\right)=\bar{y}\left(T_{-p}\left(H_{j_{i}}\right)\right)\right\} \cap \mathfrak{H}_{K, p}\left(C_{i+1}, \bar{y} C_{i+1}\right)
$$

consists of at most one element. Notice that $\sharp \mathfrak{H}_{K, p}\left(C_{1}, \bar{y} C_{1}\right)$ is minimal among all the chambers in $\mathfrak{C}\left(\mathfrak{H}_{K, p}\right)$. Thus

$$
\sharp \mathfrak{H}_{K, p}\left(C_{1}, \bar{y} C_{1}\right)=\sharp \mathfrak{H}_{K, p}\left(C_{2}, \bar{y} C_{2}\right)=\cdots=\sharp \mathfrak{H}_{K, p}\left(C_{s}, \bar{y} C_{s}\right)
$$

and $C_{1}, \ldots, C_{s} \in \mathfrak{C}_{\bar{y}}\left(\mathfrak{H}_{K, p}\right)$. By our construction $\bar{C}_{i} \cap \bar{C}_{i+1}$ spans $T_{-p}\left(H_{j_{i}}\right)$ for $i=0, \ldots, s-1$. So $C_{1}, \ldots, C_{s}$ are in the same connected component of $\left(\bigcup_{C \in \mathfrak{C}_{\bar{y}}\left(\mathfrak{H}_{K, p}\right)} \bar{C}\right) \cap V_{\mathfrak{H}_{K, p}}^{\text {subreg }}$.

Now we classify nice conjugacy classes for affine Weyl groups.
Theorem 4.6. Let $\mathcal{O}$ be a $W$-conjugacy class of $\tilde{W}$ and $\mathcal{O} \subset \tilde{W}_{G} \sigma$ for $\sigma \in \Omega^{\prime}$. Then the following conditions are equivalent:
(1) $\mathcal{O}$ is nice;
(2) for some (or, equivalently, any) $y \in \mathcal{O}, s_{H}\left(V_{y}\right)=V_{y}$ for any $H \in \mathfrak{H}\left(\nu_{y}\right)$ with $H \cap V_{y} \neq \emptyset$;
(3) for some (or, equivalently, any) $y \in \mathcal{O}$ with $\nu_{y}=\nu_{\mathcal{O}}, \bar{y}$ is a weakly elliptic element in $W_{J_{\mathcal{O}}} \rtimes\langle\sigma\rangle$.
Proof. (3) $\Rightarrow$ (2). Let $y \in \mathcal{O}$ with $\nu_{y}=\nu_{\mathcal{O}}$. Let $p \in H \cap V_{y}$ and $H^{\prime}=T_{-p} H$. Hence $s_{H^{\prime}}\left(V^{\bar{y}}\right)=V^{\bar{y}}$ by Proposition 4.2(3) and Theorem 4.4. Thus $s_{H}\left(V_{y}\right)=V_{y}$ for $V_{y}=T_{p}\left(V^{\bar{y}}\right)$.
$(2) \Rightarrow(3)$. Let $H=H_{\alpha, 0}$ with $\left\langle\nu_{y}, \alpha\right\rangle=0$. It suffices to show the $s_{H}\left(V^{\bar{y}}\right)=V^{\bar{y}}$. This is trivial if $V^{\bar{y}} \subset H$. Otherwise, $\left\langle V^{\bar{y}}, \alpha\right\rangle=\mathbb{R}$. Let $p \in V_{y}$, then $H$ intersects with $V_{y}=T_{p}\left(V^{\bar{y}}\right)$. By condition (2), $s_{H}\left(V_{y}\right)=V_{y}$. Hence $\alpha^{\vee} \in$ and $s_{H}\left(V^{\bar{y}}\right)=V^{\bar{y}}$.

## Minimal length elements of extended affine Weyl groups

(1) $\Rightarrow$ (2). Let $H \in \mathfrak{H}\left(\nu_{y}\right)$ such that $K=H \cap V_{y} \neq \emptyset$. Then $K$ is an affine subspace of $V_{y}$ of codimension at most 1 and $y K=K$. By Proposition 2.7 and [HN12, Lemma 2.3], there exists an alcove $A \in \mathfrak{A}_{y}$ whose closure contains a regular point $p$ of $K$. Since $\mathcal{O}$ is nice, applying Lemma 4.5 yields, $\left(\bigcup_{C \in \mathcal{C}_{\bar{y}}\left(\mathfrak{H}_{K, p}\right)} \bar{C}\right) \cap V_{\mathfrak{H}_{K, p}}^{\text {subreg }}$ is connected. By Theorem 4.4, we have $s_{T_{-p}(H)}\left(V^{\bar{y}}\right)=V^{\bar{y}}$, that is, $s_{H}\left(V_{y}\right)=V_{y}$.
$(2) \Rightarrow(1)$. Let $y \in \mathcal{O}$ with $\nu_{y}=\nu_{\mathcal{O}}$. By Proposition 2.4, it suffices to prove the following statement:

Let $A, A^{\prime} \in \mathfrak{A}_{y}$ such that $\bar{A}$ and $\bar{A}^{\prime}$ contain regular points of $V_{y}$. Then $A$ and $A^{\prime}$ are in the same connected component of $\left(\bigcup_{A \in \mathfrak{A}_{y}} \bar{A}\right) \cap V^{\text {subreg }}$.

Let $C$ be the connected component of $V-\bigcup_{H \in \mathfrak{H}_{V_{y}}} H$ that contains $A$ and $A^{\prime \prime}$ be the unique alcove in $C$ such that $\bar{A}^{\prime} \cap \bar{A}^{\prime \prime}$ contains a regular point $q$ of $V_{y}$. By condition (3) and $\S 4.4(\mathrm{a}),\left(\bigcup_{C \in \mathfrak{C}_{\bar{y}}\left(\mathfrak{F}_{\left.V_{y}, q\right)}\right.} \bar{C}\right) \cap V_{\mathfrak{S}_{V_{y}, q}}^{\text {subreg }}$ is connected. Hence, by Lemma $4.5, A^{\prime}$ and $A^{\prime \prime}$ are in the same connected component of $\left(\bigcup_{B \in \mathfrak{A}_{y}} \bar{B}\right) \cap V^{\text {subreg. }}$.

Similar to the proof of [HN12, Lemma 2.4], there is a sequence of- alcoves $A=A_{0}, A_{1}, \ldots$, $A_{r}=A^{\prime \prime}$ in $C$ such that $\bar{A}_{i}$ contains a regular point of $V_{y}$ and $\bar{A}_{i-1} \cap \bar{A}_{i} \cap V_{y}$ spans a codimension one affine subspace $P_{i}=H_{i} \cap V_{y}$ of $V_{y}$ for $1 \leqslant i \leqslant r$.

If $P_{i}=y P_{i}$, then $H_{i} \in \mathfrak{H}\left(\nu_{y}\right)$. By condition (2), $s_{H_{i}}\left(V_{y}\right)=V_{y}$. Since $V_{y} \nsubseteq H_{i}$, then $H_{i}$ is the affine hyperplane containing $P_{i}$ and orthogonal to $V_{y}$. Hence $H_{i}$ is the unique element in $\mathfrak{H}$ whose intersection with $V_{y}$ is $P_{i}$ and thus the unique hyperplane separating $A_{i-1}$ from $A_{i}$. So $A_{i-1}$ and $A_{i}$ are in the same connected component of $\left(\bigcup_{B \in \mathscr{H}_{y}} \bar{B}\right) \cap V^{\text {subreg }}$.

If $y P_{i} \neq P_{i}$, then there is a sequence of alcoves $A_{i-1}=B_{0}, B_{1}, \ldots, B_{s}=A_{i}$ in $C$ such that $B_{k-1}$ and $B_{k}$ have a common face and $\bar{B}_{k-1} \cap \bar{B}_{k} \cap V_{y}$ spans $P_{i}$ for $k=1, \ldots, s$. By Proposition 3.6, we see that all $B_{k} \in \mathfrak{A}_{y}$. Hence $A_{i-1}$ and $A_{i}$ are in the same connected component of $\left(\bigcup_{B \in \mathfrak{H}_{y}} \bar{B}\right) \cap V^{\text {subreg. }}$.

Hence $A$ and $A^{\prime \prime}$ are in the same connected component of $\left(\bigcup_{B \in \mathfrak{A}_{y}} \bar{B}\right) \cap V^{\text {subreg }}$.
Corollary 4.7. Let $y \in \tilde{W}$ such that $\bar{y}$ is an elliptic element in $W_{0}$. Then the $W$-conjugacy class of $y$ is nice.

Now we classify straight nice conjugacy classes.
Proposition 4.8. Let $\mathcal{O}$ be a straight $W$-conjugacy class of $\tilde{W}$ and $\mathcal{O} \subset \tilde{W}_{G} \sigma$ with $\sigma \in \Omega^{\prime}$. Then $\mathcal{O}$ is nice if and only if there exists $x \in \mathcal{O}$ such that $\nu_{x}=\nu_{\mathcal{O}}$ and $x$ is superbasic in $\tilde{W}_{J}$, where $J \subset J_{\mathcal{O}}$ is a union of connected components of Dynkin diagram of $J_{\mathcal{O}}$ and $\sigma$ fixes each element of $J_{\mathcal{O}}-J$.

Proof. Assume that $x \in \mathcal{O}$ such that $\nu_{x}=\nu_{\mathcal{O}}$ and $x$ is superbasic in $\tilde{W}_{J}$, where $J \subset J_{\mathcal{O}}$ is a union of connected components of Dynkin diagram of $J_{\mathcal{O}}$ and $\sigma$ fixes each element of $J_{\mathcal{O}}-J$. Let $H=H_{\alpha, k} \in \mathfrak{H}\left(\nu_{x}\right)$. Then $\left\langle\nu_{x}, \alpha\right\rangle=0$ and $\alpha$ is a linear combination of roots in $J_{\mathcal{O}}$. If $\alpha$ is a linear combination of roots in $J$, then by Proposition 3.5, $H \cap V_{x}=\emptyset$. If $\alpha$ is a linear combination of roots in $J_{\mathcal{O}}-J$, then $s_{H}\left(V_{x}\right)=V_{x}$ since $\alpha^{\vee} \in V^{\bar{x}}$. By Theorem 4.6, $\mathcal{O}$ is nice.

Assume that $\mathcal{O}$ is nice. By Proposition 3.2 and Theorem 4.6, there exists a basic element $x \in \tilde{W}_{J_{\mathcal{O}}}$ such that $\nu_{x}=\nu_{\mathcal{O}}$ and $\bar{x}$ is weakly elliptic in $W_{J_{\mathcal{O}}} \rtimes\langle\sigma\rangle$. Set $J=\operatorname{supp}(\bar{x})$. Then $J$ is a union of connected components of Dynkin diagram of $J_{\mathcal{O}}$ and $\sigma$ fixes each element of $J_{\mathcal{O}}-J$. Let $H=H_{\alpha, k}$ such that $\alpha$ is a linear combination of roots in $J$. By assumption, $x$ is elliptic in $W_{J} \rtimes\langle\sigma\rangle$, i.e. $V^{\bar{x}} \subset V^{W_{J}}$. We have that $V^{\bar{x}} \subset H_{\alpha, 0}$. By Proposition 3.2, $V_{x} \nsubseteq H$. Notice that $V_{x}=p+V^{\bar{x}}$ for some $p \in V_{x}$. Thus $V_{x} \cap H=\emptyset$. By Proposition 3.5, $x$ is superbasic in $\tilde{W}_{J}$.

## X. He and S. Nie

Corollary 4.9. Let $\mathcal{O}$ be a superstraight $W$-conjugacy class of $\tilde{W}$. Then $\mathcal{O}$ is nice.

## 5. Class polynomial

5.1 Set $\mathcal{A}=\mathbb{Z}\left[v, v^{-1}\right]$. The Hecke algebra $H$ associated to $W$ is the associated $\mathcal{A}$-algebra with basis $T_{w}$ for $w \in W$ and the multiplication law is given by

$$
\begin{gathered}
T_{x} T_{y}=T_{x y} \quad \text { if } \ell(x)+\ell(y)=\ell(x y), \\
\left(T_{s}-v\right)\left(T_{s}+v^{-1}\right)=0 \quad \text { for } s \in S .
\end{gathered}
$$

Then $T_{s}^{-1}=T_{s}-\left(v-v^{-1}\right)$ and $T_{w}$ is invertible in $H$ for all $w \in W$. If $\delta$ is an automorphism of $W$ with $\delta(S)=S$, then $T_{w} \mapsto T_{\delta(w)}$ induces an $\mathcal{A}$-linear automorphism of $H$ which is still denoted by $\delta$. The Hecke algebra associated to $\tilde{W}=W \rtimes \Omega$ is defined to be $\tilde{H}=H \rtimes \Omega$. It is easy to see that $\tilde{H}$ is the associated $\mathcal{A}$-algebra with basis $T_{\tilde{w}}$ for $\tilde{w} \in \tilde{W}$ and multiplication is given by

$$
\begin{gathered}
T_{\tilde{x}} T_{\tilde{y}}=T_{\tilde{x} \tilde{y}} \quad \text { if } \ell(\tilde{x})+\ell(\tilde{y})=\ell(\tilde{x} \tilde{y}), \\
\left(T_{s}-v\right)\left(T_{s}+v^{-1}\right)=0 \quad \text { for } s \in S .
\end{gathered}
$$

Let $h, h^{\prime} \in \tilde{H}$, we call $\left[h, h^{\prime}\right]=h h^{\prime}-h^{\prime} h$ the commutator of $h$ and $h^{\prime}$. Let $[\tilde{H}, \tilde{H}]$ be the $\mathcal{A}$-submodule of $\tilde{H}$ generated by all commutators.

For finite Hecke algebras, Geck and Pfeiffer introduced class polynomials in [GP93]. We will show in this section that their construction can be generalized to affine Hecke algebra based on Theorem 2.9.

Lemma 5.1. Let $\tilde{w}, \tilde{w}^{\prime} \in \tilde{W}$ with $\tilde{w} \tilde{\sim} \tilde{w}^{\prime}$. Then

$$
T_{\tilde{w}} \equiv T_{\tilde{w}^{\prime}} \quad \bmod [\tilde{H}, \tilde{H}] .
$$

Proof. By definition of $\tilde{\sim}$, it suffices to prove the case that there exists $x \in \tilde{W}$ such that $\tilde{w}^{\prime}=$ $x \tilde{w} x^{-1}$ with $\ell(\tilde{w})=\ell\left(\tilde{w}^{\prime}\right)$ and either $\ell(x \tilde{w})=\ell(x)+\ell(\tilde{w})$ or $\ell\left(\tilde{w} x^{-1}\right)=\ell(x)+\ell(\tilde{w})$.

If $\ell(x \tilde{w})=\ell(x)+\ell(\tilde{w})$, then $\ell\left(\tilde{w}^{\prime} x\right)=\ell(x \tilde{w})=\ell\left(\tilde{w}^{\prime}\right)+\ell(\delta(x))$. Hence $T_{\tilde{w}} T_{x}=T_{\tilde{w}^{\prime} x}=T_{x \tilde{w}}=$ $T_{x} T_{\tilde{w}}$ and $T_{\tilde{w}^{\prime}}=T_{x} T_{\tilde{w}} T_{x}^{-1} \equiv T_{\tilde{w}} \bmod [\tilde{H}, \tilde{H}]$.

If $\ell\left(\tilde{w} x^{-1}\right)=\ell(x)+\ell(\tilde{w})$, then $\ell\left(x^{-1} \tilde{w}^{\prime}\right)=\ell\left(\tilde{w} x^{-1}\right)=\ell\left(\tilde{w}^{\prime}\right)+\ell(x)$. Hence $T_{x^{-1}} T_{\tilde{w}^{\prime}}=T_{x^{-1}} \tilde{w}^{\prime}=$ $T_{\tilde{w} x^{-1}}=T_{\tilde{w}} T_{x^{-1}}$ and $T_{\tilde{w}}=T_{x^{-1}}^{-1} T_{\tilde{w}} T_{x^{-1}} \equiv[\tilde{H}, \tilde{H}]$.

Now Corollary 2.10(2) implies the following.
Corollary 5.2. Let $\mathcal{O}$ be a conjugacy class of $\tilde{W}$ and $\tilde{w}, \tilde{w}^{\prime} \in \mathcal{O}_{\text {min }}$. Then

$$
T_{\tilde{w}} \equiv T_{\tilde{w}^{\prime}} \quad \bmod [\tilde{H}, \tilde{H}] .
$$

Remark 3. We denote by $T_{\mathcal{O}}$ the image of $T_{\tilde{w}} \in \tilde{H} /[\tilde{H}, \tilde{H}]$ for any $\tilde{w} \in \mathcal{O}_{\text {min }}$.
Theorem 5.3. Let $\tilde{w} \in \tilde{W}$. Then for any conjugacy class $\mathcal{O}$ of $\tilde{W}$, there exists a polynomial $f_{\tilde{w}, \mathcal{O}} \in \mathbb{Z}\left[v-v^{-1}\right]$ with nonnegative coefficients such that $f_{\tilde{w}, \mathcal{O}}$ is nonzero only for finitely many $\mathcal{O}$ and

$$
\begin{equation*}
T_{\tilde{w}}=\sum_{\mathcal{O}} f_{\tilde{w}, \mathcal{O}} T_{\mathcal{O}} \in \tilde{H} /[\tilde{H}, \tilde{H}] . \tag{a}
\end{equation*}
$$

## Minimal length elements of extended affine Weyl groups

Proof. We argue by induction on $\ell(\tilde{w})$.
If $\tilde{w}$ is a minimal element in a conjugacy class of $\tilde{W}$, then we set

$$
f_{\tilde{w}, \mathcal{O}}= \begin{cases}1 & \text { if } \tilde{w} \in \mathcal{O} \\ 0 & \text { if } \tilde{w} \notin \mathcal{O}\end{cases}
$$

In this case, the statement automatically holds.
Now we assume that $\tilde{w}$ is not a minimal element in the conjugacy class of $\tilde{W}$ that contains it and that for any $\tilde{w}^{\prime} \in \tilde{W}$ with $\ell\left(\tilde{w}^{\prime}\right)<\ell(\tilde{w})$ the statement holds for $\tilde{w}^{\prime}$. By Theorem 2.9, there exist $\tilde{w}_{1} \approx \tilde{w}$ and $i \in S$ such that $\ell\left(s_{i} \tilde{w}_{1} s_{i}\right)<\ell\left(\tilde{w}_{1}\right)=\ell(\tilde{w})$. In this case, $\ell\left(s_{i} \tilde{w}\right)<\ell(\tilde{w})$ and we define $f_{\tilde{w}, \mathcal{O}}$ as

$$
f_{\tilde{w}, \mathcal{O}}=\left(v-v^{-1}\right) f_{s_{i} \tilde{w}_{1}, \mathcal{O}}+f_{s_{i} \tilde{w}_{1} s_{i}, \mathcal{O}} .
$$

By inductive hypothesis, $f_{s_{i} \tilde{w}_{1}, \mathcal{O}}, f_{s_{i} \tilde{w}_{1} s_{i}, \mathcal{O}} \in \mathbb{Z}\left[v-v^{-1}\right]$ with nonnegative coefficients. Hence $f_{\tilde{w}, \mathcal{O}} \in \mathbb{Z}\left[v-v^{-1}\right]$ with nonnegative coefficients. Moreover, there are only finitely many $\mathcal{O}$ such that $f_{s_{i} \tilde{w}_{1}, \mathcal{O}} \neq 0$ or $f_{s_{i} \tilde{w}_{1} s_{i}, \mathcal{O}} \neq 0$. Hence there are only finitely many $\mathcal{O}$ such that $f_{\tilde{w}, \mathcal{O}} \neq 0$.

By Lemma 5.1, $T_{\tilde{w}} \equiv T_{\tilde{w}_{1}} \bmod [\tilde{H}, \tilde{H}]$. Now

$$
\begin{aligned}
T_{\tilde{w}} & \equiv T_{\tilde{w}_{1}}=T_{s_{i}} T_{s_{i} \tilde{w}_{1} s_{i}} T_{s_{i}} \equiv T_{s_{i} \tilde{w}_{1 s_{i}}} T_{s_{i}} T_{s_{i}} \\
& =\left(v-v^{-1}\right) T_{s_{i} \tilde{w}_{1} s_{i}} T_{s_{i}}+T_{s_{i} \tilde{w}_{1} s_{i}}=\left(v-v^{-1}\right) T_{s_{i} \tilde{w}_{1}}+T_{s_{i} \tilde{w}_{1} s_{i}}
\end{aligned}
$$

Hence the image of $T_{\tilde{w}}$ in $\tilde{H} /[\tilde{H}, \tilde{H}]$ is

$$
\left(v-v^{-1}\right) \sum_{\mathcal{O}} f_{s_{i} \tilde{w}_{1}, \mathcal{O}} T_{\mathcal{O}}+\sum_{\mathcal{O}} f_{s_{i} \tilde{w}_{1} s_{i}, \mathcal{O}} T_{\mathcal{O}}=\sum_{\mathcal{O}} f_{\tilde{w}, \mathcal{O}} T_{\mathcal{O}} .
$$

5.2 We call $f_{\tilde{w}, \mathcal{O}}$ in the above theorem the class polynomial associated to $w$ and $\mathcal{O}$.

Notice that the construction of $f_{\tilde{w}, \mathcal{O}}$ depends on the choice of the sequence of elements in $S$ used to conjugate $\tilde{w}$ to a minimal length element in its conjugacy class. We will show in the next section that $f_{\tilde{w}, \mathcal{O}}$ is in fact, independent of such choice and is uniquely determined by the identity (a) in Theorem 5.3. For a finite Hecke algebra, a similar result was obtained by Geck and Rouquier in [GR97, Theorem 4.2].

## 6. Cocenter of $\tilde{\boldsymbol{H}}$

6.1 We call $\tilde{H} /[\tilde{H}, \tilde{H}]$ the cocenter of $\tilde{H}$. Now for any conjugacy class $\mathcal{O}$ of $\tilde{W}$, we choose a minimal length representative $\tilde{w}_{\mathcal{O}}$. By Theorem $5.3, T_{\mathcal{O}}$, where $\mathcal{O}$ ranges over all conjugacy classes of $\tilde{W}$, spans the cocenter of $\tilde{H}$. The main purpose of this section is to show that $T_{\mathcal{O}}$ are linearly independent in the cocenter of $\tilde{H}$ and thus form a basis. We call it the standard basis of $\tilde{H} /[\tilde{H}, \tilde{H}]$.
6.2 Following [Lus87a], let $J$ be the based ring of $W$ with basis $\left(t_{w}\right)_{w \in W}$. For each $\delta \in \Omega$, the map $t_{w} \mapsto t_{\delta(w)}$ gives a ring homomorphism of $J$, which we still denote by $\delta$. Set $\tilde{J}=J \rtimes \Omega$, $J_{\mathcal{A}}=J \otimes_{\mathbb{Z}} \mathcal{A}$ and $\tilde{J}_{\mathcal{A}}=\tilde{J} \otimes_{\mathbb{Z}} \mathcal{A}$.

Let $\left(c_{w}\right)_{w \in W}$ be the Kazhdan-Lusztig basis of $H$. Then $c_{x} c_{y}=\sum_{z \in W} h_{x, y, z} c_{z}$ with $h_{x, y, z} \in \mathcal{A}$. There is a homomorphism of $\mathcal{A}$-algebras $\varphi: H \rightarrow J_{\mathcal{A}}$ defined by $c_{w} \mapsto \sum_{d \in \mathcal{D}, a(d)=a(x)} h_{w, d, x} t_{x}$,

## X. He and S. Nie

where $a: \tilde{W} \rightarrow \mathbb{N}$ is Lusztig's $a$-function and $\mathcal{D}$ is the set of distinguished involutions of $W$. It is easy to see that for each $\delta \in \Omega$

$$
\varphi\left(\delta\left(c_{w}\right)\right)=\varphi\left(c_{\delta(w)}\right)=\sum_{d \in \mathcal{D}, a(d)=a(x)} h_{\delta(w), \delta(d), \delta(x)} t_{\delta(x)}=\delta \varphi\left(c_{w}\right) .
$$

Hence $\varphi$ extends in a natural way to a homomorphism $\tilde{\varphi}: \tilde{H} \rightarrow \tilde{J}_{\mathcal{A}}$.
6.3 Set $J_{\mathbb{C}}=J \otimes_{\mathbb{Z}} \mathbb{C}$ and $\tilde{J}_{\mathbb{C}}=\tilde{J} \otimes_{\mathbb{Z}} \mathbb{C}$. Set $H_{\mathbb{C}}=H \otimes_{\mathcal{A}} \mathbb{C}\left[v, v^{-1}\right]$ and $\tilde{H}_{\mathbb{C}}=\tilde{H} \otimes_{\mathcal{A}} \mathbb{C}\left[v, v^{-1}\right]$. For any $q \in \mathbb{C}^{\times}$, let $\mathbb{C}_{q}$ be the one-dimensional $\mathcal{A}$-module over $\mathbb{C}$ such that $v$ acts as the scalar $q$. Set $H_{q}=H \otimes_{\mathcal{A}} \mathbb{C}_{q}$ and $\tilde{H}_{q}=\tilde{H} \otimes_{\mathcal{A}} \mathbb{C}_{q}$.

Let $E$ be a $\tilde{J}_{\mathbb{C}}$-module. Through the homomorphism

$$
\tilde{\varphi}_{q}=\left.\tilde{\varphi}\right|_{v=q}: \tilde{H}_{q} \rightarrow \tilde{J}_{\mathbb{C}}
$$

it is endowed with an $\tilde{H}_{q}$-module structure. We denote this $\tilde{H}_{q}$-module by $E_{q}$.
For an associative $\mathbb{C}$-algebra $R$, we denote by $\mathrm{K}(R)$ the Grothendieck group of all finitedimensional representations of $R$ over $\mathbb{C}$.

Thus the map $E \mapsto E_{q}$ induces a homomorphism $\left(\tilde{\varphi}_{q}\right)_{*}: \mathrm{K}\left(\tilde{J}_{\mathbb{C}}\right) \rightarrow \mathrm{K}\left(\tilde{H}_{q}\right)$. We have the following lemma.
Lemma 6.1. The map $\left(\tilde{\varphi}_{q}\right)_{*}: K\left(\tilde{J}_{\mathbb{C}}\right) \rightarrow K\left(\tilde{H}_{q}\right)$ is surjective.
Proof. The proof is similar to [Lus87b, Lemma 1.9]. Since $\Omega$ preserves $a$-function, we associate to each $\tilde{H}_{q}$-module $M$ an integer $a_{M}$ such that $c_{w} M=0$ whenever $a(w)>a_{M}$ and $c_{w^{\prime}} M \neq 0$ for some $w^{\prime} \in W$ with $a\left(w^{\prime}\right)=a_{M}$. For each simple $\tilde{H}_{q}$-module $M$, we construct as in the proof of [Lus87b, Lemma 1.9] a finite-dimensional $\tilde{J}_{\mathbb{C}}$-module $\tilde{M}$ and a nonzero $\tilde{H}_{q}$-morphism $p: \tilde{M}_{q} \rightarrow M$ with $M^{\prime}=\operatorname{ker} p$ such that $a_{M^{\prime}}<a_{M}$. Since the $a$-function is bounded, it follows easily that $\left(\tilde{\varphi}_{q}\right)_{*}$ is surjective.
6.4 Let $\mathrm{K}^{*}\left(\tilde{H}_{q}\right)=\operatorname{Hom}_{\mathbb{Z}}\left(\mathrm{K}\left(\tilde{H}_{q}\right), \mathbb{C}\right)$ be the space of linear functions on $\mathrm{K}\left(\tilde{H}_{q}\right)$. The map $\tilde{H}_{q} \rightarrow$ $\mathrm{K}^{*}\left(\tilde{H}_{q}\right)$ sending $h \in \tilde{H}_{q}$ to the function $M \mapsto \operatorname{Tr}_{M}(h)$ on $\mathrm{K}\left(\tilde{H}_{q}\right)$ induces a map

$$
\Psi_{q}: \tilde{H}_{q} /\left[\tilde{H}_{q}, \tilde{H}_{q}\right] \rightarrow \mathrm{K}^{*}\left(\tilde{H}_{q}\right) .
$$

It is proved in [Kaz86, Theorem B] and [Fli95, Main Theorem] that $\Psi_{q}$ is injective if $q$ is a prime power. We will show below that $\Psi_{1}$ is also injective. Here $\tilde{H}_{1}=\mathbb{C}[\tilde{W}]$ is the group algebra.

Lemma 6.2. Let $\tilde{w}, \tilde{w}^{\prime} \in \tilde{W}$. If $\tilde{w}$ and $\tilde{w}^{\prime}$ are not in the same conjugacy class of $\tilde{W}$, then there exists $n>0$ such that the images of $\tilde{w}$ and $\tilde{w}^{\prime}$ in $\tilde{W} / n P$ are not in the same conjugacy class.

Proof. It suffices to consider the case where $\tilde{W} \subset W \rtimes \operatorname{Aut}(W, S)$. Then we have that $\tilde{W} / W$ is finite. Notice that $Q$ is a normal subgroup of $\tilde{W}$ and $\tilde{W} / m Q$ is a quotient group of $\tilde{W}$. Since $\tilde{W} / W$ and $W / Q$ are both finite groups, $\tilde{W} / Q$ is also a finite group. We choose a representative $x_{i}$ for each coset of $Q$. Set $\tilde{w}_{i}=x_{i} \tilde{w} x_{i}^{-1}$. Then any element conjugate to $\tilde{w}$ is of the form $t^{\lambda} \tilde{w}_{i} t^{-\lambda}$ for some $i$ and $\lambda \in Q$.

Now we show that the following holds.
(a) For any $i$, there exists $n_{i}>0$ such that the images of $\tilde{w}_{i}$ and $\tilde{w}^{\prime}$ are not conjugate by an element in $n_{i} Q$.

## Minimal length elements of extended affine Weyl groups

Otherwise, there exists $i$ such that $\tilde{w}^{\prime}=t^{\chi} \tilde{w}_{i}$ for some $\chi \in Q$ such that $\chi \in\left(1-\tilde{w}_{i}\right) Q+n Q$ for all $n>0$. Therefore the image of $\chi$ in $Q /\left(1-\tilde{w}_{i}\right) Q$ is divisible by all the positive integer $n$. So the image of $\chi$ in $Q /\left(1-\tilde{w}_{i}\right) Q$ is 0 and $\chi=\lambda-\tilde{w}_{i} \lambda$ for some $\lambda \in Q$. Hence $\tilde{w}^{\prime}=t^{\lambda} \tilde{w}_{i} t^{-\lambda}$ is conjugate to $\tilde{w}$ in $\tilde{W}$. That is a contradiction. Hence (a) is proved.

Now set $n=\Pi_{i} n_{i}$. If the images of $\tilde{w}$ and $\tilde{w}^{\prime}$ in $\tilde{W} / n Q$ are in the same conjugacy class, then there exists $i$ such that the images of $\tilde{w}_{i}$ and $\tilde{w}^{\prime}$ in $\tilde{W} / n Q$ are conjugate by an element in $Q$. Hence their images in $\tilde{W} / n Q \rightarrow \tilde{W} / n_{i} Q$ are conjugate by an element in $Q$. That contradicts (a).

Proposition 6.3. Let $\tilde{w}_{1}, \ldots, \tilde{w}_{r} \in \tilde{W}$ be elements in distinct conjugacy classes of $\tilde{W}$. Then the elements $\Psi_{1}\left(\tilde{w}_{1}\right), \ldots, \Psi_{1}\left(\tilde{w}_{r}\right)$ are linearly independent functions on $K(\mathbb{C}[\tilde{W}])$.

Proof. Again, it suffices to consider the case where $\tilde{W} / Q$ is finite.
For any $1 \leqslant i<j \leqslant r$, there exists $n_{i j}>0$ such that the image of $\tilde{w}_{i}$ and $\tilde{w}_{j}$ in $\tilde{W} / n_{i j} Q$ are not in the same conjugacy class.

Set $n=\prod_{1 \leqslant i<j \leqslant r} n_{i j}$ and $F=\tilde{W} / n P$. Then $F$ is a finite group. Let $\underline{\tilde{w}}_{i}$ be the image of $\tilde{w}_{i}$ in $F$. If $\underline{\tilde{w}}_{i}$ and $\underline{\tilde{w}}_{j}$ are in the same conjugacy class of $F$, then their images in $\tilde{W} / n_{i j} P$ under the map $F \rightarrow \tilde{W} / n_{i j} P$ are still in the same conjugacy class. That is a contradiction. Hence $\underline{\underline{w}}_{1}, \ldots, \tilde{\underline{w}}_{r}$ are in distinct conjugacy classes of $F$.

The surjection $\tilde{W} \rightarrow F$ induces an injection $\mathrm{K}(\mathbb{C}[F]) \rightarrow \mathrm{K}(\mathbb{C}[\tilde{W}])$ and a surjection $\mathrm{K}^{*}(\mathbb{C}[\tilde{W}]) \rightarrow \mathrm{K}^{*}(\mathbb{C}[F])$. We have the following commutative diagram.

Here $\Psi: F \rightarrow \mathrm{~K}^{*}(\mathbb{C}[F])$ is defined in the same way as $\Psi_{q}$ in $\S$ 6.4.
Since $F$ is a finite group and $\underline{\underline{w}}_{1}, \ldots, \underline{\underline{w}}_{r}$ are in distinct conjugacy classes of $F$, then $\Psi\left(\underline{\underline{w}}_{1}\right)$, $\ldots, \Psi\left(\underline{\tilde{w}}_{r}\right)$ are linearly independent functions on $\mathrm{K}(\mathbb{C}[F])$. Hence $\Psi_{1}\left(\tilde{w}_{1}\right), \ldots, \Psi_{1}\left(\tilde{w}_{r}\right)$ are linearly independent functions on $\mathrm{K}(\mathbb{C}[\tilde{W}])$.

Corollary 6.4. The map $\Psi_{1}: \mathbb{C}[\tilde{W}] /[\mathbb{C}[\tilde{W}], \mathbb{C}[\tilde{W}]] \rightarrow K^{*}(\mathbb{C}[\tilde{W}])$ is injective.
Now we prove the main result of this section.
ThEOREM 6.5. Let $\tilde{w}_{1}, \ldots, \tilde{w}_{r} \in \tilde{W}$ be elements in distinct conjugacy classes of $\tilde{W}$. Then the image of $T_{\tilde{w}_{1}}, \ldots, T_{\tilde{w}_{r}}$ in $\tilde{H}_{\mathbb{C}} /\left[\tilde{H}_{\mathbb{C}}, \tilde{H}_{\mathbb{C}}\right]$ are linearly independent.

Proof. Set $\mathcal{A}_{\mathbb{C}}=\mathbb{C}\left[v, v^{-1}\right]$. Assume that $\sum_{i=1}^{r} c_{i} T_{\tilde{w}_{i}} \in\left[\tilde{H}_{\mathbb{C}}, \tilde{H}_{\mathbb{C}}\right]$ with all $c_{i} \in \mathcal{A}_{\mathbb{C}}$. Suppose that not all the $c_{i}$ are 0 . Then there exist $c \in \mathcal{A}_{\mathbb{C}}$ and $c_{i}^{\prime} \in \mathcal{A}_{\mathbb{C}}$ for $1 \leqslant i \leqslant r$ such that $c_{i}=c c_{i}^{\prime}$ and there exists $1 \leqslant s \leqslant r$ with $\left.c_{s}^{\prime}\right|_{v=1} \neq 0$.

Let $E$ be a $\tilde{J}$-module over $\mathbb{C}$. Set $E_{\mathbb{C}}=E \otimes \mathbb{C} \mathcal{A}_{\mathbb{C}}$. Then $E_{\mathbb{C}}$ is a $\tilde{J}_{\mathcal{A}_{\mathbb{C}}}$-module over $\mathcal{A}_{\mathbb{C}}$. Via the homomorphism $\tilde{\varphi}: \tilde{H} \rightarrow \tilde{J}_{\mathcal{A}}, E_{\mathbb{C}}$ admits an $\tilde{H}_{\mathbb{C}}$-module structure over $\mathcal{A}_{\mathbb{C}}$. We denote it by $E_{\varphi}$. For $h \in \tilde{H}$, let $\operatorname{Tr}_{E}(h) \in \mathcal{A}_{\mathbb{C}}$ be the trace of the endomorphism $h$ on $E_{\varphi}$ over $\mathcal{A}_{\mathbb{C}}$. Then $\operatorname{Tr}_{E}\left(\sum_{i=1}^{r} c_{i} T_{\tilde{w}_{i}}\right)=c\left(\sum_{i=1}^{r} c_{i}^{\prime} \operatorname{Tr}_{E}\left(T_{\tilde{w}_{i}}\right)\right)=0 \in \mathcal{A}_{\mathbb{C}}$. Since $\mathcal{A}_{\mathbb{C}}$ is an integral domain and $c \neq 0$, we have that $\sum_{i=1}^{r} c_{i}^{\prime} \operatorname{Tr}_{E}\left(T_{\tilde{w}_{i}}\right)=0$ for all $\tilde{J}$-modules $E$. Set $v=1$; then

$$
\begin{equation*}
\left.\sum_{i=1}^{r} c_{i}^{\prime}\right|_{v=1} \operatorname{Tr}_{E}\left(T_{\tilde{w}_{i}}\right)=0 \tag{a}
\end{equation*}
$$

## X. He and S. Nie

for all $\tilde{J}$-module $E$. Hence, by Lemma 6.1, (a) holds for all $\tilde{W}$-modules. Now by Proposition 6.3 , $\left.c_{i}^{\prime}\right|_{v=1}=0$ for all $i$. That is a contradiction.

Corollary 6.6. The class polynomial $f_{\tilde{w}, \mathcal{O}}$ is uniquely determined by the identity (a) in Theorem 5.3.

Now combining Theorem 5.3 and Theorem 6.5, we have the following theorem.
Theorem 6.7. The set $\left\{T_{\mathcal{O}}\right\}$, where $\mathcal{O}$ ranges over the conjugacy classes of $W$, is a $\mathcal{A}$-basis of $\tilde{H} /[\tilde{H}, \tilde{H}]$.
