Engerix-B®

Hepatitis B Vaccine (Recombinant)

See complete prescribing information in SmithKline Beecham Pharmaceuticals Literature or PDR. The following is a brief summary.

INDICATIONS AND USAGE: 'Engerix-B' is indicated for immunization against infection caused by all known subtypes of hepatitis B virus. Immunization is recommended in persons of all ages, especially those who are, or will be, at increased risk of exposure to hepatitis B virus.

CONTRAINDICATIONS: Hypersensitivity to yeast or any other component of the vaccine is a contraindication for use of the vaccine.

WARNINGS: Do not give additional injections to patients experiencing hypersensitivity after an 'Engerix-B' injection. (See CONTRAINDICATIONS.)

Hepatitis B has a long incubation period. Hepatitis B vaccination may not prevent hepatitis B infection in individuals who had an unrecognized hepatitis B infection at the time of vaccine administration. Additionally, it may not prevent infection in individuals who do not achieve protective antibody titers.

PRECAUTIONS: General: As with any percutaneous vaccine, keep epinephrine available for use in case of anaphylaxis or anaphylactoid reaction.

As with any vaccine, delay administration, if possible, in persons with any febrile illness or active infection.

Pregnancy: Pregnancy Category C: Animal reproduction studies have not been conducted with 'Engerix-B'. It is also not known whether 'Engerix-B' can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Give 'Engerix-B' to a pregnant woman only if clearly needed.

Nursing Mothers: It is not known whether 'Engerix-B' is excreted in human milk. Because many drugs are excreted in human milk, use caution when giving 'Engerix-B' to a nursing woman.

Pediatric Use: 'Engerix-B' has been shown to be well tolerated and highly immunogenic in infants and children of all ages. Newborns also respond well; maternally transferred antibodies do not interfere with the active immune response to the vaccine.

ADVERSE REACTIONS: 'Engerix-B' is generally well tolerated. During clinical studies involving over 10,000 individuals distributed over all age groups, no serious adverse reactions attributable to vaccine administration were reported. As with any vaccine, however, it is possible that expanded commercial use of the vaccine could reveal rare adverse reactions not observed in clinical studies.

Ten double-blind studies involving 2,252 subjects showed no significant difference in the frequency or severity of adverse experiences between 'Engerix-B' and plasma-derived vaccines. In 36 clinical studies a total of 13,495 doses of 'Engerix-B' were administered to 5,071 healthy adults and children who were initially seronegative for hepatitis B markers, and healthy neonates. All subjects were monitored for 4 days post-administration. Frequency of adverse experiences tended to decrease with successive doses of 'Engerix-B'. Using a symptom checklist, the most frequently reported adverse reactions were injection site soreness (22%), and fatigue (14%). Other reactions are listed below:

Incidence 1% to 10% of Injections: Induration; erythema; swelling; fever (>37.5°C); headache; dizziness.

*Parent or guardian completed forms for children and neonates. Neonatal checklist did not include headache, fatigue or dizziness.

Incidence <1% of Injections: Pain; pruritus; ecchymosis; sweating; malaise; chills; weakness; flushing; tingling; hypotension; influenza-like symptoms; upper respiratory tract illnesses; nausea; anorexia; abdominal pain/cramps; vomiting; constipation; diarrhea; lymphadenopathy; pain/stiffness in arm, shoulder or neck; arthralgia, myalgia; back pain; rash; urticaria; petechiae; erythema; somnolence; insomnia; irritability; agitation.

Additional adverse experiences have been reported with the commercial use of 'Engerix-B' outside the United States. Those listed below are to serve as alerting information to physicians: Anaphylaxis; erythema multiforme including Stevens-Johnson syndrome; angioedema; arthritis; tachycardia/palpitations; bronchospasm including asthma-like symptoms; abnormal liver function tests; migraine; syncope; paresis; neuropathy including hypoesthesia, paresthesia, Guillain-Barré syndrome and Bell's palsy; transverse myelitis; thrombocytopenia; eczema; purpura; herpes zoster; vertigo; conjunctivitis; keratitis; visual disturbances.

Potential Adverse Experiences: In addition, certain other adverse experiences not observed with 'Engerix-B' have been reported with Heptavax-B®† and/or Recombivax HB®‡. Those listed below are to serve as alerting information to physicians: Optic neuritis.

HOW SUPPLIED: 20 mcg/mL in Single-Dose Vials in packages of 1, 10 and 25 vials.

NDC 58160-860-01 (package of 1)
NDC 58160-860-11 (package of 10)
NDC 58160-860-16 (package of 25)

10 mcg/0.5 mL in Single-Dose Vials in packages of 1 vial.
NDC 58160-859-01 (package of 1)

†plasma-derived, Hepatitis B Vaccine, MSD
‡yeast-derived, Hepatitis B Vaccine, MSD.

UNTIL WE FIND A CURE, THIS IS THE BEST MEDICINE.

You know what they say about laughter. About sunshine. And about love.

Thousands of children with neuromuscular diseases know, too — thanks to special summer camps sponsored by the Muscular Dystrophy Association.

Each summer, MDA camps provide a special outdoor world-without-barriers to children disabled by neuromuscular disorders. Despite leg braces and wheelchairs, these children swim and fish. They go boating. They horseback ride. They have cookouts and crafts. And each youngster shares a special friendship with a volunteer counselor who works one-on-one with the child.

Summer camps are just one way MDA serves patients with neuromuscular diseases. The Association also maintains some 230 clinics around the country to provide essential services like diagnosis, medical follow-up, physical therapy and counseling. And MDA provides orthopedic equipment and other aids for daily living, all free of charge to the patient and his family.

MDA receives no government grants or fees for services — its programs are funded entirely by private donations. For thousands of patients with neuromuscular diseases, you can be the best medicine. Please send a tax-deductible contribution today.

INFECTION CONTROL AND HOSPITAL EPIDEMIOLOGY

The Society for Hospital Epidemiology of America (SHEA) and SLACK Inc. Copyright and Republication Policy

The Society for Hospital Epidemiology of America (SHEA) and SLACK Inc. hold copyright on *Infection Control and Hospital Epidemiology*. We request that all authors of works transfer to SHEA and SLACK Inc. all rights, title, and interest to such works, including copyright. In accord with the Copyright Act of 1976, we must acquire every author's signature to effect the transfer. A written work cannot be considered for publication until the 'Assignment of Copyright' form is signed by the author or authors and is on file at the editorial offices. Please submit this signed form with your manuscript. In the event that a manuscript is not accepted for publication, this agreement will be returned to the authors.

Signed 'Assignment of Copyright' forms confirm that a work submitted has not previously been published, is not subject to copyright or other rights except those of the author to be transferred to SHEA and SLACK Inc., and is not under consideration for publication elsewhere, except under circumstances communicated to us in writing at the time the work is submitted.

Permission to reproduce any part of the works published by SHEA and SLACK Inc. in *Infection Control and Hospital Epidemiology* in any form or by any means, electronic or mechanical, is not permitted without written permission from SLACK Inc.

Assignment of Copyright

In consideration of SLACK Incorporated and The Society for Epidemiology of America (collectively called the 'Publisher') in publishing my (our) submitted manuscript, the undersigned hereby transfer(s), assign(s), and otherwise convey(s) all copyright in the manuscript to the Publisher. The undersigned declares that the manuscript is original and, to the best of the undersigned's knowledge, contains no matter that is libelous or unlawful or that infringed upon anyone else's rights of copyright.

In addition, we affirm that the work is the work of every author listed, and is not under consideration for publication elsewhere, except under circumstances communicated to us in writing at the time the work is submitted.

OSHA VAPOR LIMIT

OSHA has set
0.2 ppm as the
permissible exposure limit
for glutaraldehyde.¹

Sporicidin offers important
advantages. When diluted for 100%
hospital level disinfection, it contains
0.13% glutaraldehyde. With good cross-
ventilation, this can avoid the need for special
ventilation equipment to stay within the never-to-
be exceeded ceiling of 0.2 ppm.

Greater ventilation and space areas are required
when using 2% glutaraldehyde solutions. It is
reported that a room volume of air 550 times greater
than that of the soaking container is needed for 2%
glutaraldehyde, while only 33 times greater is
needed for Sporicidin.²

It's reassuring to know that you can
lessen the risk of over-exposure to
glutaraldehyde, offer greater
protection to your staff
and reduce your space
and ventilation
requirements as
well by using

**ANOTHER REASON
