CLIO MEDICA

The history of therapeutics has been central to the medical enterprise in all times and all places. It is also, as Guenter Risse points out in his introductory essay, a subject which is all too often neglected by historians. He analyses some of the reasons for this and urges historians to take this complex and important theme more seriously. The essays which follow range in chronology from antiquity to the 1980s and in geography from the Mediterranean Basin to the New World. They touch on such matters as diet and drugs, magic and surgery, orthodox and unorthodox approaches. What they share is an attempt to get beyond the easy dismissal of almost all therapeutics before the twentieth century as meaningless and harmful and to examine concrete dimensions of the therapeutic encounter in its social, professional, religious and scientific reverberations.

In the development of modern cardiological drugs, chance observation, intense prolonged chemical investigation, studies of disease in animals, and patients' own findings have all played a part, and Arthur Hollman's account of these discoveries makes fascinating reading. A keen amateur botanist who is also a member of the Committee of Management of the Chelsea Physic Garden, and a Fellow of the Linnean Society, Dr. Hollman has woven medical and botanical information into succinct and elegantly written articles. His book will be of great value to everyone who is interested in nature's contribution to medicine, including cardiologists, doctors, pharmacists, botanists, herbalists and medical historians.
