We have experimentally proved that Listerine is a powerful antiseptic, preventing the development of bacteria and decomposition of vegetable infusions.—British Medical Journal, May 3, 1890.

LISTERINE is an efficient, non-toxic ANTISEPTIC of known and definite power, prepared in a form convenient for immediate use.

It is a saturated solution of boric acid, reinforced by the antiseptic properties of ozoniferous oils.

It is unirritating, even when applied to the most delicate tissue.

It does not coagulate serous albumen.

It is quite generally accepted as the standard antiseptic preparation for use where a poisonous or corrosive disinfectant can not be safely used.

It is particularly useful in the treatment of abnormal conditions of the mucosa, and admirably suited for a wash, gargle or douche in catarrhal conditions of the nose and throat.

In proper dilution, it may be freely and continuously used without prejudicial effect, either by injection or spray, in all the natural cavities of the body.

There is no possibility of poisonous effect through the absorption of Listerine.

A pamphlet descriptive of the antiseptic, and indicating its utility in medical, surgical and dental practice, may be had upon application to the manufacturers, Lambert Pharmacal Co., Locust and Twenty-first Streets, St. Louis, Missouri, U.S.A., or to their British Agents, Messrs. S. Maw, Son & Sons, 7-12, Aldersgate Street, London, Eng., but the best advertisement of Listerine is . . . . . . . . . .

Persistent Hæmorrhage.

COAGULOSE (P., D. & Co.), a sterile, soluble, anhydrous preparation of normal blood serum, containing the fibrin ferment necessary to produce coagulation of the blood, is of great service in all cases of hæmorrhage due to defective coagulation of the blood—e.g., epistaxis, pulmonary hæmorrhage, hæmorrhage during and after turbinectomy, tonsillotomy or other operation. Its administration is also indicated, prophylactically, prior to surgical or dental operations on hæmophiliac subjects.

MODE OF USE.—Dissolve the Coagulose in sterile, distilled water, and inject hypodermically; for application to accessible bleeding surfaces the powder may be dusted on sterile gauze.

FURTHER PARTICULARS WILL BE SUPPLIED ON REQUEST.

Ivory statuette of a Sumerian lady with bands crossed as in statues of Sumerian Royal personages. The Sumerian shawl, which forms part of the costume, is draped in the manner characteristic of the period, and is ornamented as shown in the border to this page. The grain of the ivory may be seen on the body of the dress. Date, circa 2000 B.C.
