

**MIAMI NATURAL RADIOCARBON CORRECTIONS I-III\***

H. GÖTE ÖSTLUND, ALBERT L. BOWMAN, and GENE A. RUSNAK\*\*

Institute of Marine Science, University of Miami, Florida

A systematic error of calculation has been included in all radiocarbon age figures released from this laboratory (Miami I, II, and III). The error affects dates of all materials, organic and inorganic, terrestrial and marine, in the same way, namely making them about 410 yr too young. Instead of adding to the confusion by correcting the old age figures we preferred to recalculate the dates starting from the measured isotope ratios. Table 1 below reports the correct age figures as calculated in the following way:

The present-day value of  $\Delta$  for each sample was calculated from the measured isotopic ratios using Broecker's formula (Lamont VIII).

$$\Delta = \delta C^{14} - (2 \delta C^{13} + 50) (1 + 0.001 \delta C^{14}) \quad (1)$$

When at zero age, the sample was formed, its  $C^{14}$  assay was  $\Delta_0$ . The age is then calculated from:

$$\text{Age} = -\frac{t_{1/2}}{\ln 2} \ln \frac{1000 + \Delta}{1000 + \Delta_0} \quad (2)$$

For samples deriving their carbon from the air we consider  $\Delta_0 = 0$ . For samples deriving their carbon from sea-water we take  $\Delta_0 = -50$ . The latter figure is considered a good sea surface water average before A.D. 1960, as calculated from values by Broecker and Olson (Lamont VIII) and Fonselius and Östlund (1959). Calculated in this way, the "age" for marine samples is expressed as the *elapsed  $C^{14}$  time* since the organism was living in the sea. This time span is 410 yr less than the *apparent  $C^{14}$  age*.

Some samples, diluted before counting, were previously assigned too low sigma figures. These errors are also corrected in this list.

\* Contribution No. 606 from the Marine Laboratory, Institute of Marine Science, University of Miami.

\*\* Present address: U. S. Geological Survey, Menlo Park, California.

TABLE 1

Correct  $C^{14}$  dates from Miami I, II, and III

$C^{13}$  values in parenthesis are measurements on similar material. M or T in the fourth column denotes marine or terrestrial material respectively.
