Sol-Gel synthesis is one of the best chemical processes to make nanocrystalline powders of various complex solids of uniform composition and size. Various lanthanide based metal oxides are synthesized by employing citrate route. Scanning Electron Microscopy and EDX analysis is employed to study the morphology, particle size and distribution of particle size and chemical composition. Variable pressure SEM equipment is used for this purpose and the results are presented here. The compounds synthesized and characterized are, LaMnO₃, La₀.₅Ca₀.₅MnO₃, Nd₀.₅Ca₀.₅MnO₃ and LaFeO₃. The particle size of all the samples prepared is around 25 nm and chemical compositions from EDX analysis are found to be stoichiometric with in experimental errors.
