ATOMIC DECOMPOSITION OF WEIGHTED
TRIEBEL–LIZORKIN SPACES ON SPACES
OF HOMOGENEOUS TYPE

(Received 14 June 2009; accepted 14 September 2010)

Communicated by A. J. Pryde

Abstract

We obtain an atomic decomposition for weighted Triebel–Lizorkin spaces on spaces of homogeneous type, using the area function, the discrete Calderón reproducing formula and discrete sequence spaces.

2010 Mathematics subject classification: primary 42B35; secondary 42B20, 46E.

Keywords and phrases: weighted Triebel–Lizorkin spaces, atomic decomposition, Calderón reproducing formula, spaces of homogeneous type.

1. Introduction and statement of main result

Spaces of homogeneous type were introduced by Coifman and Weiss [3] in the 1970s in order to extend the Calderón–Zygmund theory of singular integrals to a more general setting. These spaces have no translations or dilations, no analogues of the Fourier transform or convolution, and no group structure. Examples of spaces of homogeneous type include Euclidean space, the \( n \)-torus, smooth compact Riemannian manifolds, the boundaries of Lipschitz domains, and \( d \)-sets in \( \mathbb{R}^n \).

Recently, based on the works of Christ [1] and David et al. [4], Deng and Han [5] developed a version of harmonic analysis on spaces of homogeneous type, using discrete Littlewood–Paley–Stein analysis. They first defined test function spaces and the so-called distribution spaces on spaces of homogeneous type, and then proved a new ‘\( T \)1-theorem’, namely, the boundedness on a test function space of a certain class of Calderón–Zygmund operators whose kernels satisfy an additional second-order smoothness condition. Next, they established several discrete Calderón reproducing formulas on spaces of homogeneous type. As an application of these results, they...
studied function spaces on spaces of homogeneous type, including $L^p$, where $1 < p < \infty$, the generalized Sobolev spaces $\dot{L}^{p,s}$, the Hardy spaces $H^p$, the bounded mean oscillation space and the Besov spaces. Theorems of $T1$ type on these spaces are also proved. Han [10, 11] studied Triebel–Lizorkin spaces on spaces of homogeneous type, using discrete Littlewood–Paley–Stein analysis. See also [16, 18, 22].

We recall the definition of Muckenhoupt weights. A weight $w$ belongs to $A_q$, where $1 < q < \infty$, if there is a constant $C_q$ such that

$$\sup_{B \subset X} \left( \frac{1}{\mu(B)} \int_B w(x) \, d\mu(x) \right)^q \left( \frac{1}{\mu(B)} \int_B w(x)^{-1/(q-1)} \, d\mu(x) \right)^{q-1} \leq C_q. \quad (1.1)$$

The class $A_1$ is defined by letting $q$ tend to 1, that is,

$$\sup_{B \subset X} \left( \frac{1}{\mu(B)} \int_B w(x) \, d\mu(x) \right) \|w^{-1}\|_{L^\infty(B)} \leq C_1,$$

where $C_1$ depends only on $w$. These classes, in the Euclidean setting, were introduced by Muckenhoupt [20] and developed by Coifman and Fefferman [2]; see also García-Cuerva and Rubio de Francia [9]. For more information on Muckenhoupt weights, we refer the reader to Stein [21].

In this paper, we consider weights that belong to the class $A_\infty$, which is the union of the classes $A_q$ when $1 \leq q < \infty$; we define the critical index $q_w$ of $w$ by

$$q_w = \inf\{ q > 1 : w \in A_q \}.$$

García-Cuerva and Martell [8] found the wavelet characterization of the weighted Hardy space $H^p_w(\mathbb{R})$. Deng et al. [6] gave an atomic characterization of the weighted Triebel–Lizorkin spaces $\dot{F}^{\alpha,q}_{p,w}(\mathbb{R}^n)$, using an idea of [8], namely, of combining wavelet analysis and the theory of vector-valued Calderón–Zygmund operators. See [6, Theorem 1].

The aim of this paper is to study weighted Triebel–Lizorkin spaces on spaces of homogeneous type and present an atomic decomposition of functions in these spaces. The main tools used are the area function and the discrete Calderón reproducing formula. We also study the duality between these weighted Triebel–Lizorkin spaces by considering weighted sequence spaces, and the lifting and projection operators on the weighted Triebel–Lizorkin spaces. Sequence spaces originated in the work of Frazier and Jawerth [7], and were developed by Deng and Han [5] in the single-parameter case and by Han, Lu and the author [13, 14] in the multi-parameter cases.

We now begin by recalling the definitions necessary for introducing weighted Triebel–Lizorkin spaces on spaces of homogeneous type. A quasi-metric $d$ on a set $X$ is a function $d : X \times X \rightarrow [0, \infty)$ satisfying the conditions:

(i) $d(x, y) = 0$ if and only if $x = y$;
(ii) $d(x, y) = d(y, x)$ for all $x, y \in X$;
(iii) there exists a constant $A \in [1, \infty)$ such that $d(x, y) \leq A[d(x, z) + d(z, y)]$ for all $x, y, z \in X$. 

https://doi.org/10.1017/S144678871000159X Published online by Cambridge University Press
Any quasi-metric defines a topology, whose balls \( B(x, r) = \{ y \in X : d(y, x) < r \} \) form a base. But the balls need not be open if \( A > 1 \).

We now state the definition of a space of homogeneous type.

**Definition 1.1** [3]. A space of homogeneous type \((X, d, \mu)\) is a set \( X \) with a quasi-metric \( d \) and a nonnegative Borel regular measure \( \mu \) on \( X \) such that \( 0 < \mu(B(x, r)) < \infty \) (for all \( x \in X \) and all \( r > 0 \)) and there exists a positive constant \( A' \) such that

\[
\mu(B(x, 2r)) \leq A' \mu(B(x, r))
\]

for all \( x \in X \) and \( r > 0 \). Here \( \mu \) is assumed to be defined on a \( \sigma \)-algebra which contains all Borel sets and all balls \( B(x, r) \).

We suppose that \( \mu(X) = \infty \) and \( \mu(\{x\}) = 0 \) for all \( x \in X \). It was shown by Macías and Segovia [19, Theorems 2 and 3] that, in this case, \( \rho'(x, y) \), the infimum of the measures \( \mu(B) \) where \( B \) runs over the balls containing \( x \) and \( y \), is a quasi-metric on \( X \) yielding the same topology as \( d \). Further, there is a quasi-metric \( \rho \) equivalent to \( \rho' \) in the sense that there is a constant \( C \) such that \( C^{-1} \rho'(x, y) \leq \rho(x, y) \leq C \rho(x, y) \) for all \( x, y \in X \), and there are constants \( C \) and \( 0 < \theta < 1 \) such that

\[
C^{-1}r \leq \mu(B(x, r)) \leq Cr
\]

for all \( x \in X \) and \( r > 0 \), and

\[
|\rho(x, y) - \rho(x', y)| \leq C \rho(x, x')^\theta \rho(x, y) (\rho(x, y) + \rho(x', y))^{1-\theta}
\]

for all \( x, x', y \in X \). For more on spaces of homogeneous type, see [5, Section 1.2].

We now recall the notion of an approximation to the identity on \( X \).

**Definition 1.2** [5]. A sequence \( \{S_k\}_{k \in \mathbb{Z}} \) of operators is said to be an approximation to the identity of order \( \epsilon \in (0, \theta] \) if there exists a constant \( C > 0 \) such that for all \( k \in \mathbb{Z} \) and all \( x, x', y, y' \in X \), the kernel \( S_k(\cdot, \cdot) \) of the operator \( S_k \) is a function from \( X \times X \) to \( \mathbb{C} \) satisfying

\[
|S_k(x, y)| \leq C \frac{2^{-k \epsilon}}{(2^{-k} + \rho(x, y))^{1+\epsilon}}; \tag{1.2}
\]

\[
|S_k(x, y) - S_k(x', y)| \leq C \left( \frac{\rho(x, x')}{2^{-k} + \rho(x, y)} \right)^\epsilon \frac{2^{-k \epsilon}}{(2^{-k} + \rho(x, y))^{1+\epsilon}} \tag{1.3}
\]

when \( \rho(x, x') \leq (2A)^{-1} (2^{-k} + \rho(x, y)) \);

\[
|S_k(x, y) - S_k(x', y')| \leq C \left( \frac{\rho(y, y')}{2^{-k} + \rho(x, y)} \right)^\epsilon \frac{2^{-k \epsilon}}{(2^{-k} + \rho(x, y))^{1+\epsilon}} \tag{1.4}
\]

when \( \rho(y, y') \leq (2A)^{-1} (2^{-k} + \rho(x, y)) \);

\[
|S_k(x, y) - S_k(x, y') - S_k(x', y) + S_k(x', y')| \leq C \left( \frac{\rho(x, x')}{2^{-k} + \rho(x, y)} \right)^\epsilon \left( \frac{\rho(y, y')}{2^{-k} + \rho(x, y)} \right)^\epsilon \frac{2^{-k \epsilon}}{(2^{-k} + \rho(x, y))^{1+\epsilon}} \tag{1.5}
\]
We now introduce the weighted Triebel–Lizorkin spaces \( f \). Then for every \( G \) to \( C \) let \( M \) be the set of all \( (\beta, \gamma) \) such that \( \| \cdot \|_{M(\beta, \gamma)} \) is \( \alpha \)-Hölder continuous for \( 0 < \beta \leq \epsilon \). Let \( \tilde{M} \) be the set of all \( (\beta, \gamma) \) such that \( \tilde{M}(\beta, \gamma) \) is \( \alpha \)-Hölder continuous for \( 0 < \beta \leq \epsilon \). Examples of approximations to the identity on Euclidean space include the Gaussian kernel and the Poisson kernel.

Definition 1.4 [5]. Fix \( \gamma > 0 \) and \( 0 < \beta \leq \epsilon \). We say that a function \( f \) defined on \( X \) belongs to \( M(x_0, r, \beta, \gamma) \) if it satisfies the following conditions:

(i) \[ |f(x)| \leq C \frac{r^\gamma}{(r + \rho(x, x_0))^{1+\gamma}}; \]

(ii) \[ |f(x) - f(y)| \leq C \left( \frac{\rho(x, y)}{r + \rho(x, x_0)} \right)^\beta \frac{r^\gamma}{(r + \rho(x, x_0))^{1+\gamma}} \]

for all \( x, y \in X \) with \( \rho(x, y) \leq (2A)^{-1}(r + \rho(x, x_0)) \).

For a fixed \( x_0 \in X \), we write \( M(\beta, \gamma) = M(x_0, 1, \beta, \gamma) \), and define

\[ \| f \|_{M(\beta, \gamma)} = \inf \{ C > 0 : (i) \text{ and (ii) hold} \}. \]

Let \( M_0(\beta, \gamma) \) be the set of all \( f \in M(\beta, \gamma) \) such that \( \int_X f(x) \, d\mu(x) = 0 \). Its dual space, denoted by \( (M_0(\beta, \gamma))' \), consists of all linear functionals \( L \) from \( M_0(\beta, \gamma) \) to \( \mathbb{C} \) for which there exists a constant \( C \) such that \( |L(f)| \leq C \| f \|_{M_0(\beta, \gamma)} \) for all \( f \in M_0(\beta, \gamma) \).

Let \( \{ S_k \} \) be an approximation to the identity of order \( \epsilon \), and set \( D_k = S_k - S_{k-1} \). Then for every \( f \in (M_0(\beta, \gamma))' \), where \( 0 < \beta, \gamma < \epsilon \), we define the Littlewood–Paley \( G \)-function and the \( S \)-function by

\[ G_{\alpha,q}(f)(x) = \left\{ \sum_k (2^k |D_k(f)(x)|)^q \right\}^{1/q}; \quad (1.7) \]

\[ S_{\alpha,q}(f)(x) = \left\{ \sum_k \int_{\rho(x,y)\leq C_22^{-k}} 2^k (2^k |D_k(f)(y)|)^q \, d\mu(y) \right\}^{1/q}. \quad (1.8) \]

We now introduce the weighted Triebel–Lizorkin spaces \( \dot{F}_{p,q}(X) \).

Remark 1.3. An approximation to the identity was constructed by Coifman as follows. Take a nonnegative smooth function \( h \) equal to 1 on \([1, 9]\) and supported in \([0, 10]\). Let \( H_k \) be the operator with kernel \( 2^k h(2^k \cdot) \). The doubling condition on \( \mu \) and the construction of \( h \) imply that there is a constant \( C \geq 1 \) such that \( C^{-1} \leq H_k(1) \leq C \) for all \( k \in \mathbb{Z} \). Let \( M_k \) and \( W_k \) be the operators of pointwise multiplication by \( (H_k(1))^{-1} \) and \( m_k = (H_k(H_k(1))^{-1})^{-1} \) respectively, and finally let \( \tilde{M}_k = M_k H_k W_k H_k M_k \). It is easy to check that this \( \tilde{M}_k \) satisfies conditions (i)–(iv) of Definition 1.2. Examples of approximations to the identity on Euclidean space include the Gaussian kernel and the Poisson kernel.
DEFINITION 1.5. Suppose that $-\epsilon < \alpha < \epsilon$ while $\min(1 + \alpha + \epsilon, 1 + \epsilon)^{-1} < p < \infty$ and $1 < q < \infty$. Given $w \in A_\infty$ with $q_w \leq q$, the weighted Triebel–Lizorkin space $\dot{F}^{\alpha,q}_{p,w}(X)$, where $0 < \beta, \gamma < \epsilon$, is the collection of all $f \in (M_0(\beta, \gamma))^\prime$ that satisfy

$$\|f\|_{\dot{F}^{\alpha,q}_{p,w}(X)} = \|G_{\alpha,q}(f)\|_{L^p_w(X)} < \infty,$$

where the $L^p_w(X)$ are weighted $L^p$ spaces.

In particular, when $w = 1$, we denote $\dot{F}^{\alpha,q}_{p,w}(X)$ by $\dot{F}^{\alpha,q}_{p}(X)$.

DEFINITION 1.6. Suppose that $-\epsilon < \alpha < \epsilon$ and $\min(1 + \alpha + \epsilon, 1 + \epsilon)^{-1} < p \leq 1 < q < \infty$. A function $a \in (M_0(\beta, \gamma))^\prime$, where $0 < \beta, \gamma < \epsilon$, is said to be a $(p, q, \alpha)$-atom for $\dot{F}^{\alpha,q}_{p,w}(X)$ if

$$\supp \ a \subset B = B(x_0, r);$$

$$\|a\|_{\dot{F}^{\alpha,q}_{q,w}(X)} \leq w(B)^{1/q - 1/p},$$

$$\int_X a(x) \ d\mu(x) = 0.$$

Here is the main result of this paper.

THEOREM 1.7. Suppose that $-\epsilon < \alpha < \epsilon$ and $\min(1 + \alpha + \epsilon, 1 + \epsilon)^{-1} < p \leq 1 < q < \infty$. Given $w \in A_\infty$ for which $q_w \leq q$, a function $f$ defined on $X$ belongs to $\dot{F}^{\alpha,q}_{p,w}(X)$ if and only if $f$ has a decomposition

$$f(x) = \sum_{k=0}^{\infty} \lambda_k a_k(x),$$

where the series converges in the sense of $(M_0(\beta, \gamma))^\prime$ where $0 < \beta, \gamma < \epsilon$, the $a_k$ are $(p, q, \alpha)$-atoms, and $\sum_k |\lambda_k|^p < \infty$. Furthermore,

$$\|f\|_{\dot{F}^{\alpha,q}_{p,w}(X)} \approx \inf \left( \sum_{k=0}^{\infty} |\lambda_k|^p \right)^{1/p},$$

where the infimum is taken over all such decompositions.

This paper is organized as follows. In Section 2 we recall the continuous and discrete Calderón reproducing formulas on spaces of homogeneous type, and obtain the Plancherel–Pólya inequalities for $\dot{F}^{\alpha,q}_{p,w}(X)$ and an equivalence of $\dot{F}^{\alpha,q}_{p,w}(X)$ in terms of the $S$-function. In Section 3, we use the sequence spaces of Frazier and Jawerth to obtain the duality of $\dot{F}^{\alpha,q}_{p,w}(X)$ (see Theorem 3.5 below). The proof of our main result, Theorem 1.7, is given in Section 4 by combining the results of Section 3, estimates of the area function, and the continuous Calderón reproducing formula.

Throughout, $C$ will denote (possibly different) constants that are independent of the essential variables. Further, $A \approx B$ means that the ratio $A/B$ is bounded and bounded away from zero by constants that do not depend on the relevant variables in $A$ and $B$. And $q'$ denotes the conjugate index of $q \in (1, \infty)$, that is, $1/q + 1/q' = 1$.

2. Some basic results

We first recall a result of Christ [1], which gives an analogue of the Euclidean dyadic cubes.

**Lemma 2.1** [1]. Let \((X, \rho, \mu)\) be a space of homogeneous type. Then there exist a collection \(\{Q^k_\alpha \subset X : k \in \mathbb{Z}, \alpha \in I_k\}\) of open subsets, where \(I_k\) is some index set, and constants \(C_1, C_2 > 0\), such that:

(i) \(\mu(X \setminus \bigcup_\alpha Q^k_\alpha) = 0\) for each fixed \(k\) and \(Q^k_\alpha \cap Q^k_\beta = \emptyset\) if \(\alpha \neq \beta\);

(ii) for all \(\alpha, \beta, k, \ell \) where \(\ell \geq k\), either \(Q^\ell_\beta \subset Q^k_\alpha\) or \(Q^\ell_\beta \cap Q^k_\alpha = \emptyset\);

(iii) for each \((k, \alpha)\) and each \(\ell < k\), there is a unique \(\beta\) such that \(Q^k_\alpha \subset Q^\ell_\beta\);

(iv) \(\text{diam}(Q^k_\alpha) \leq C_1 2^{-k}\);

(v) each \(Q^k_\alpha\) contains a ball \(B(y^k_\alpha, C_2 2^{-k})\), where \(y^k_\alpha \in X\).

We think of \(Q^k_\alpha\) as a dyadic cube with diameter roughly \(2^{-k}\) and center \(y^k_\alpha\). We define \(CQ^k_\alpha\) to be the dyadic cube with the same center as \(Q^k_\alpha\) and diameter \(C \text{diam}(Q^k_\alpha)\). When \(k \in \mathbb{Z}\) and \(\tau \in I_k\), we denote by \(Q^k_\tau, v\), where \(v = 1, 2, \ldots, N(k, \tau)\), the set of all cubes \(Q^{k+J}_\tau \subset Q^k_\tau\), where \(J\) is a fixed large positive integer, and by \(y^k_\tau, v\) a point in \(Q^k_\tau, v\).

We now state the continuous and the discrete Calderón reproducing formulas on spaces of homogeneous type, as developed in [5].

**Proposition 2.2** (Continuous Calderón reproducing formula). Suppose that \(\{S_k\}_k\) is an approximation to the identity of order \(\epsilon\). Set \(D_k = S_k - S_{k-1}\) for all \(k \in \mathbb{Z}\). Then there exists a family of operators \(\{\tilde{D}_k\}_k\) such that

\[
f = \sum_k D_k \tilde{D}_k(f), \tag{2.1}
\]

for all \(f \in (M_0(\beta, \gamma))', \) the dual of \(M_0(\beta, \gamma)\), and the series converges in the sense that

\[
\lim_{M \to \infty} \left| \sum_{|k| \leq M} D_k \tilde{D}_k(f), g \right| = 0
\]

for all \(g \in M_0(\beta', \gamma')\), where \(0 < \beta < \beta'\) and \(0 < \gamma < \gamma'\). Moreover, the kernel of \(\tilde{D}_k\) satisfies (1.2) and (1.4) with \(\epsilon\) replaced by \(\epsilon'\), where \(0 < \epsilon' < \epsilon\), and

\[
\int_X \tilde{D}_k(x, y) \, d\mu(x) = \int_X \tilde{D}_k(x, y) \, d\mu(y) = 0.
\]

**Proposition 2.3** (Discrete Calderón reproducing formula). Suppose that \(\{S_k\}_k\) is an approximation to the identity of order \(\epsilon\), and set \(D_k = S_k - S_{k-1}\) for all \(k \in \mathbb{Z}\). Then there exists a family of operators \(\{\tilde{D}_k\}_k\) such that, for all \(f \in M_0(\beta, \gamma)\),

\[
f(x) = \sum_k \sum_{\tau \in I_k} \sum_{v=1}^{N(k, \tau)} \mu(Q^k_\tau, v) \tilde{D}_k(x, y^k_\tau, v) D_k(f)(y^k_\tau, v), \tag{2.2}
\]
where the series converges in the norm of $\mathcal{M}_0(\beta', \gamma')$, where $0 < \beta' < \beta$ and $0 < \gamma' < \gamma$, and also in the space $\mathcal{M}_0(\beta'', \gamma'')$ where $0 < \beta < \beta''$ and $0 < \gamma < \gamma''$. Moreover, the kernel of $\hat{D}_k$ satisfies (1.2) and (1.3) with $\epsilon$ replaced by $\epsilon'$, where $0 < \epsilon' < \epsilon$, and

$$\int_X \hat{D}_k(x, y) \, d\mu(x) = \int_X \hat{D}_k(x, y) \, d\mu(y) = 0.$$  

In order to verify that the definition of $\dot{F}^{\alpha, q}_{p, w}(X)$ is independent of the choices of approximations to the identity, we need the following Plancherel–Pólya inequalities.

**Lemma 2.4.** Suppose that $\{S_k\}_{k \in \mathbb{Z}}$ and $\{P_k\}_{k \in \mathbb{Z}}$ are approximations to the identity of order $\epsilon$, $D_k = S_k - S_{k-1}$ and $E_k = P_k - P_{k-1}$. Then when $f \in (\mathcal{M}_0(\beta, \gamma))'$ where $0 < \beta, \gamma < \epsilon$, $-\epsilon < \alpha < \epsilon$ and $\min(1 + \alpha + \epsilon, 1 + \epsilon)^{-1} < p, q < \infty$,

$$\left\| \left\{ \sum_{k \in \mathbb{Z}} \sum_{\tau \in I_k} \sum_{v=1}^{N(k, \tau)} \left[ \mu(Q^{k, v}_\tau) - \alpha \sup_{x \in Q^{k, v}_\tau} |D_k(f)(x)| \chi_{Q^{k, v}_\tau}(\cdot) \right] \right\}^q \right\|_{L_w^p}^{1/q} \approx \left\| \left\{ \sum_{k \in \mathbb{Z}} \sum_{\tau \in I_k} \sum_{v=1}^{N(k, \tau)} \left[ \mu(Q^{k, v}_\tau) - \alpha \inf_{x \in Q^{k, v}_\tau} |E_k(f)(x)| \chi_{Q^{k, v}_\tau}(\cdot) \right] \right\}^q \right\|_{L_w^p}^{1/q} \quad (2.3)$$

The proof of Lemma 2.4 is similar to that of [5, Theorem 4.6] with only minor modifications. We omit the details here.

Using the definition of $Q^{k, v}_\tau$ and Lemma 2.4, we see that when $f \in \dot{F}^{\alpha, q}_{p, w}(X)$,

$$\left\| \left\{ \sum_{k \in \mathbb{Z}} \sum_{\tau \in I_k} \sum_{v=1}^{N(k, \tau)} \left[ \mu(Q^{k, v}_\tau) - \alpha \inf_{x \in Q^{k, v}_\tau} |D_k(f)(x)| \chi_{Q^{k, v}_\tau}(\cdot) \right] \right\}^q \right\|_{L_w^p}^{1/q} \approx \left\| \left\{ \sum_{k \in \mathbb{Z}} \sum_{\tau \in I_k} \sum_{v=1}^{N(k, \tau)} \left[ \mu(Q^{k, v}_\tau) - \alpha \sup_{x \in Q^{k, v}_\tau} |E_k(f)(x)| \chi_{Q^{k, v}_\tau}(\cdot) \right] \right\}^q \right\|_{L_w^p}^{1/q} \approx \left\| \left\{ \sum_{k \in \mathbb{Z}} \left(2^{k\alpha} |D_k(f)(\cdot)| \right)^q \right\} \right\|_{L_w^p}^{1/q} = \| G_{\alpha, q}(f) \|_{\dot{F}^{\alpha, q}_{p, w}(X)} = \| f \|_{\dot{F}^{\alpha, q}_{p, w}(X)}.$$  

This shows that the definition of $\dot{F}^{\alpha, q}_{p, w}(X)$ is independent of the choice of the approximation to the identity.

To obtain an atomic decomposition for $\dot{F}^{\alpha, q}_{p, w}(X)$, we need an equivalent characterization of $\dot{F}^{\alpha, q}_{p, w}(X)$ in terms of area function. More precisely, we have the following result.

**Lemma 2.5.** For all $f \in \dot{F}^{\alpha, q}_{p, w}(X)$,

$$\| f \|_{\dot{F}^{\alpha, q}_{p, w}(X)} = \| G_{\alpha, q}(f) \|_{L_w^p} \approx \| S_{\alpha, q}(f) \|_{L_w^p}.$$
PROOF. From (1.8) and Lemma 2.4, we obtain

\[
\| S_{\alpha, q}(f) \|_{L^p_w}
\]

\[
= \left\| \left\{ \sum_k \int_{\rho(x, y) \leq C_3 2^{-k}} 2^k (2^{k\alpha} |D_k(f)(y)|)^q \, d\mu(y) \right\} \right\|_{L^p_w}^{1/q}
\]

\[
= \left\| \left\{ \sum_k \sum_{\tau \in I_k} \sum_{v=1}^{N(k, \tau)} \int_{\rho(x, y) \leq C_3 2^{-k}} 2^k (2^{k\alpha} |D_k(f)(y)|)^q \, d\mu(y) \chi_{CQ_k^\tau}(x) \right\} \right\|_{L^p_w}^{1/q}
\]

\[
\leq \left\| \left\{ \sum_k \sum_{\tau \in I_k} \sum_{v=1}^{N(k, \tau)} \int_{\rho(x, y) \leq C_3 2^{-k}} 2^k \left( 2^{k\alpha} \sup_{z \in CQ_k^\tau} |D_k(f)(z)| \right)^q \, d\mu(y) \chi_{CQ_k^\tau}(x) \right\} \right\|_{L^p_w}^{1/q}
\]

\[
\leq C \left\{ \sum_k \sum_{\tau \in I_k} \sum_{v=1}^{N(k, \tau)} \left( 2^{k\alpha} \inf_{z \in CQ_k^\tau} |D_k(f)(z)| \right)^q \chi_{CQ_k^\tau}(x) \right\} \right\|_{L^p_w}^{1/q}
\]

On the other hand,

\[
\| S_{\alpha, q}(f) \|_{L^p_w}
\]

\[
\geq \left\| \left\{ \sum_k \sum_{\tau \in I_k} \sum_{v=1}^{N(k, \tau)} \int_{\rho(x, y) \leq C_3 2^{-k}} 2^k \right. \left. \times \left( 2^{k\alpha} \inf_{z \in CQ_k^\tau} |D_k(f)(z)| \right)^q \, d\mu(y) \chi_{CQ_k^\tau}(x) \right\} \right\|_{L^p_w}^{1/q}
\]

\[
\geq C \left\{ \sum_k \sum_{\tau \in I_k} \sum_{v=1}^{N(k, \tau)} \left( 2^{k\alpha} \inf_{z \in CQ_k^\tau} |D_k(f)(z)| \right)^q \chi_{CQ_k^\tau}(x) \right\} \right\|_{L^p_w}^{1/q}
\]

\[
\geq C \| G_{\alpha, q}(f) \|_{L^p_w}
\]

which proves Lemma 2.5. \qed

LEMMA 2.6. If \( w \in A_q \), where \( 1 < q < \infty \), then

\[
\mu(Q) \leq w(Q)^{1/q} (w^\flat(Q))^{(q-1)/q} \leq C_q \mu(Q),
\]

(2.4)

where \( w(Q) = \int_Q w(x) \, d\mu(x) \), \( w^\flat = w^{-1/(q-1)} \) and \( w^\flat(Q) = \int_Q w(x)^{-1/(q-1)} \, d\mu(x) \).
PROOF. From (1.1),
\[
\frac{1}{\mu(Q)} \int_Q d\mu(x) = \frac{1}{\mu(Q)} \int_Q w(x)^{1/q} w(x)^{-1/q} d\mu(x) \\
\leq \left( \frac{1}{\mu(Q)} \int_Q w(x) d\mu(x) \right)^{1/q} \\
\times \left( \frac{1}{\mu(Q)} \int_Q w(x)^{-1/(q-1)} d\mu(x) \right)^{(q-1)/q} \\
\leq C_q.
\]
This proves (2.4). □

3. Duality of weighted Triebel–Lizorkin spaces

In recent years Han and Lu have developed an approach to the Hardy spaces $H^p$ and Carleson measure spaces $CMO^p$, where $p \leq 1$ and near 1, and obtained the duality, using discrete Littlewood–Paley–Stein analysis. More precisely, they defined a type of sequence spaces $s^p$ and $c^p$, and proved that $H^p$ can be lifted to $s^p$ and $s^p$ can be projected to $H^p$. Moreover, the composition of the lifting and projection operators is equal to the identity operator on $H^p$. Similar results hold for $CMO^p$ and $c^p$. Then, they showed the duality between $s^p$ and $c^p$. Finally, by working on the level of sequence spaces, they obtained the duality between $H^p$ and $CMO^p$. Their methods can be applied to the multi-parameter product case [13], the multi-parameter case with implicit flag structures [14] and also the multi-parameter case with Zygmund dilations [15].

In this section, we will show that the dual space of $\dot{F}^{\alpha, q}_{\mu, w}(X)$ is $\dot{F}^{-\alpha, q'}_{\mu, w}(X)$ when $-\epsilon < \alpha < \epsilon$, $1 < q < \infty$ and $w \in A_{\infty}$ where $q_w \leq q$ and $w' = w^{-1/(q-1)} = w^{b} \in A_{q'}$. Following [5], we introduce sequence spaces.

**Definition 3.1.** Let $\tilde{\chi}_Q(x) = \mu(Q)^{-1/2} \chi(x)$. When $-\epsilon < \alpha < \epsilon$ and $1 < p, q < \infty$, the sequence space $f^{\alpha, q}_{p, w}$ is defined to be the set of all complex-valued sequences
\[
s = \{ s^{k,v}_{Q^{k,v}} \}_{k \in \mathbb{Z}; \tau \in I_k; v=1,...,N(k,\tau)}
\]
such that
\[
\|s\|_{f^{\alpha, q}_{p, w}} = \left\| \left\{ \sum_k \sum_{\tau \in I_k} \sum_{v=1}^{N(k,\tau)} (\mu(Q^{k,v})^{-\alpha} |s^{k,v}_{Q^{k,v}}| \tilde{\chi}_{Q^{k,v}}(\cdot))^q \right\}^{1/q} \right\|_{L^q_w} < \infty.
\]

We now prove the following theorem.

**Theorem 3.2.** When $-\epsilon < \alpha < \epsilon$ and $1 < q < \infty$,
\[
(f^{\alpha, q}_{q, w})' = f^{-\alpha, q'}_{q', w'}.
\]
PROOF. Given a sequence \( t \in \tilde{f}^{\alpha,q'}_{q',w'} \), set

\[
L(s) = \sum_k \sum_{\tau \in I_k} \sum_{v=1}^{N(k,\tau)} s_{Q^k_{\tau,v}}\tilde{T}_{Q^k_{\tau,v}},
\]

for all sequences \( s \in \tilde{f}^{\alpha,q}_{q,w} \). By Hölder’s inequality,

\[
|L(s)| \leq \int \sum_k \sum_{\tau \in I_k} \sum_{v=1}^{N(k,\tau)} \mu(Q^k_{\tau,v})^{-\alpha} |s_{Q^k_{\tau,v}}|\tilde{T}_{Q^k_{\tau,v}}(x)w^{1/q}(x)
\]

\[
\times \mu(Q^k_{\tau,v})^\alpha |\tilde{T}_{Q^k_{\tau,v}}(x)w^{-1/q}(x)\,d\mu(x)
\]

\[
\leq \|s\|_{\tilde{f}^{\alpha,q}_{q,w}} \|t\|_{\tilde{f}^{\alpha,q'}_{q',w'}},
\]

and hence \( \tilde{f}^{\alpha,q}_{q,w} \subseteq (\tilde{f}^{\alpha,q'}_{q',w'})' \).

Conversely, for every \( L \in (\tilde{f}^{\alpha,q}_{q,w})' \), we see that

\[
L(s) = \sum_k \sum_{\tau \in I_k} \sum_{v=1}^{N(k,\tau)} s_{Q^k_{\tau,v}}\tilde{T}_{Q^k_{\tau,v}}
\]

for some sequence \( t = \{t_{Q^k_{\tau,v}}\}_{k \in \mathbb{Z} ; \tau \in I_k ; v = 1,...,N(k,\tau)} \). Define

\[
L^q_w(l^q) = \left\{ f = \{f_k\} : \|f\|_{L^q_w(l^q)} = \left\| \left( \sum_{k \in \mathbb{Z}} |f_k|^q \right)^{1/q} \right\|_{L^q_w} \right\}.
\]

Then \( (L^q_w(l^q))' = L^{q'}_{w'}(l^{q'}) \) when \( 1 < q < \infty \), with the obvious pairing, namely,

\[
f \mapsto \int_X \sum_k f_k(x) \tilde{g}_k(x) \,d\mu(x)
\]

when \( g = \{g_k\} \in L^{q'}_{w'}(l^{q'}) \), and the map \( \text{In} \) from \( \tilde{f}^{\alpha,q}_{q,w} \) to \( L^q_w(l^q) \) defined by \( \text{In}(s) = \{f_k(s)\} \), where

\[
f_k(s) = \sum_{\tau \in I_k} \sum_{v=1}^{N(k,\tau)} \mu(Q^k_{\tau,v})^{-\alpha} s_{Q^k_{\tau,v}}\tilde{T}_{Q^k_{\tau,v}},
\]

is a linear isometry onto a subspace of \( L^q_w(l^q) \). By the Hahn–Banach theorem, there exists \( \tilde{L} \in L^{q'}_{w'}(l^{q'}) \) with \( \|\tilde{L}\| = \|L\| \) such that \( \tilde{L} \circ \text{In} = L \). In other words, there exists \( g = \{g_k\} \in L^{q'}_{w'}(l^{q'}) \) with \( \|g\|_{L^{q'}_{w'}(l^{q'})} \leq \|L\| \) such that

\[
\tilde{L} \circ \text{In}(s) = L(s) = \int_X \sum_k f_k(x) \tilde{g}_k(x) \,d\mu(x)
\]
for all $s \in \dot{H}^{\alpha,q}_{q,w}$. Substituting the expression for $f_k$ into this formula, we obtain

$$L(s) = \sum_k \sum_{\tau \in I_k} \sum_{v=1}^{N(k,\tau)} s_{Q_{k,v}} \tilde{t}_{Q_{k,v}},$$

where

$$t_{Q_{k,v}} = \int_{Q_{k,v}} g(y) \, d\mu(y) / \mu(Q_{k,v})^{(\alpha+1)/2}.$$ 

Denote by $M$ the Hardy–Littlewood maximal operator. Using the vector-valued maximal inequality, we see that

$$\|f\|_{\dot{H}^{\alpha,q'}_{q',w'}} \leq \|M(g)\|_{L_{q'}(w')} \leq C \|g\|_{L_{q'}(w')} \leq C \|L\|.$$ 

This completes the proof of Theorem 3.2.

We recall the lifting and projection operators defined in [5].

**Definition 3.3.** Let $y_{k,v}^{k,v}$ be the center of $Q_{k,v}^{k,v}$ as in Lemma 2.1.

(i) For a function $f \in (M_0(\beta, \gamma))'$, we define

$$S_D(f) = \{\mu(Q_{k,v}^{k,v})^{1/2} D_k(f)(y_{k,v}^{k,v})\}_{k \in \mathbb{Z}; \tau \in I_k; v=1,...,N(k,\tau)}.$$  

(ii) For a sequence $s \in \dot{H}^{\alpha,q}_{q,w}$, we define

$$T_D(s)(x) = \sum_k \sum_{\tau \in I_k} \sum_{v=1}^{N(k,\tau)} s_{Q_{k,v}} \mu(Q_{k,v}^{k,v})^{1/2} \tilde{D}_k(x, y_{k,v}^{k,v}).$$

To obtain the duality of weighted Triebel–Lizorkin spaces, we need to work at the level of sequence spaces.

**Proposition 3.4.** Let $S_D$ and $T_D$ be the operators in Definition 3.3. Then for all $f \in \dot{F}^{\alpha,q}_{q,w}(X)$,

$$\|S_D(f)\|_{\dot{F}^{\alpha,q}_{q,w}(X)} \leq C \|f\|_{\dot{F}^{\alpha,q}_{q,w}(X)}.$$  

Conversely, for all sequences $s \in \dot{F}^{\alpha,q}_{q,w}$,

$$\|T_D(s)\|_{\dot{F}^{\alpha,q}_{q,w}(X)} \leq C \|s\|_{\dot{F}^{\alpha,q}_{q,w}}.$$  

Moreover, $T_D \circ S_D$ is equal to the identity on $\dot{F}^{\alpha,q}_{q,w}(X)$.

**Proof.** Estimate (3.4) follows directly from Lemma 2.4 and Definition 3.3.

We now prove (3.5). To simplify our notation, we work with dyadic cubes of the form $\{Q_{k}^{k,v} : k \in \mathbb{Z}, \tau \in I_{k+1}\}$. Set

$$m_{Q_{k}^{k,v}}(x) = \mu(Q_{k}^{k,v})^{1/2} \tilde{D}_k(x, y_{k,v}^{k,v}).$$

https://doi.org/10.1017/S144678871000159X Published online by Cambridge University Press
From the size and cancellation conditions on $D_j$ and $\tilde{D}_k$,

$$D_j(m_{Q_k^\ell}(x)) \leq C\mu(Q_{\tau_k}^\ell)^{1/2} 2^{-(j-k)\varepsilon'} \frac{1}{(1 + 2^k \rho(x, \gamma_k^\ell))^{1/2^{\varepsilon'}}}. \quad (3.6)$$

Write

$$\|T_{\tilde{D}}(s)\|_{L^{\alpha,q,w}(\mathbb{R})} = \left\| \left\{ \sum_j (2j^\alpha |D_j(T_{\tilde{D}}(s))|)^q \right\}^{1/q} \right\|_{L^q_w} \leq \left\| \left\{ \sum_j (2j^\alpha \sum_{k > j} \sum_{\tau \in I_{k+j}} |s_{Q_{\tau_k}^\ell}| |D_j(m_{Q_k^\ell}(\cdot))|)^q \right\}^{1/q} \right\|_{L^q_w} + \left\| \left\{ \sum_j (2j^\alpha \sum_{k \leq j} \sum_{\tau \in I_{k+j}} |s_{Q_{\tau_k}^\ell}| |D_j(m_{Q_k^\ell}(\cdot))|)^q \right\}^{1/q} \right\|_{L^q_w} =: T_1 + T_2,$$

say. We first estimate the term $T_1$. Denote

$$a = \{a_k\}_k = \left\{ M\left(\mu(Q_{\tau_k}^\ell)^{-\alpha} \sum_{\tau \in I_{k+j}} |s_{Q_{\tau_k}^\ell}| |\tilde{X}_{Q_{\tau_k}^\ell}(\cdot)| \right) \right\}_k;$$

$$b = \{b_k\}_k = \left\{ 2^{k(\varepsilon'+\alpha)} \chi_{\{k \in \mathbb{Z} : k < 0\}}(k) \right\}_k.$$

Then Young’s inequality and the vector-valued maximal inequality, together with the formula

$$(a * b)_j(x) = \sum_k a_k(x)b_{j-k},$$

give

$$T_1 \leq C \|a * b(\cdot)\|_q \|_L^q_w \leq C \|a(\cdot)\|_q \|b\|_q \|_L^q_w \leq C \|a(\cdot)\|_q \|b\|_q \|_L^q_w \leq C \|s\|_{j_{\alpha,q,w}}$$

where the first inequality is because $\mu(Q_{\tau_k}^\ell)^{-\alpha} \approx 2^{k\alpha}$ and

$$\sum_{k > j} \sum_{\tau \in I_{k+j}} |s_{Q_{\tau_k}^\ell}| |D_j(m_{Q_k^\ell}(x))| \leq C \sum_{k > j} 2^{(j-k)\varepsilon'} M \left( \sum_{\tau \in I_{k+j}} |s_{Q_{\tau_k}^\ell}| |\tilde{X}_{Q_{\tau_k}^\ell}(\cdot)| \right)(x).$$

A similar argument shows that $T_2 \leq C \|s\|_{j_{\alpha,q,w}}$. This completes the proof of (3.5). \[\square\]
Finally, we prove a duality result of weighted Triebel–Lizorkin spaces.

**Theorem 3.5.** Suppose that $0 < \beta, \gamma < \epsilon$, while $-\epsilon < \alpha < \epsilon$ and $1 < q < \infty$. Then

$$(\dot{F}^{\alpha,q}_{q,w}(X))' = \dot{F}^{-\alpha,q'}_{q',w'}(X).$$

More precisely, if $g \in \dot{F}^{-\alpha,q'}_{q',w'}(X)$, then the map $L_g$, defined by $L_g(f) = \langle f, g \rangle$, initially for $f \in M_0(\beta, \gamma)$, extends to a continuous linear functional on $\dot{F}^{\alpha,q}_{q,w}(X)$ and

$$\|L_g\| \approx \|g\|_{\dot{F}^{-\alpha,q'}_{q',w'}(X)}.$$

Conversely, every $L \in (\dot{F}^{\alpha,q}_{q,w}(X))'$ is equal to $L_g$ for some $g \in \dot{F}^{-\alpha,q'}_{q',w'}(X)$.

**Proof.** If $g \in \dot{F}^{-\alpha,q'}_{q',w'}(X)$ and $f \in M_0(\beta, \gamma)$, then from Proposition 3.4,

$$\langle f, g \rangle = \langle T_{\tilde{D}} \circ S_D(f), g \rangle \equiv \langle S_D(f), S_{\tilde{D}}(g) \rangle,$$

where

$$S_{\tilde{D}}(g) = \{\mu(Q^k_{\tau})^{1/2} \tilde{D}_k(g)(y^k_{\tau})\}_{k \in \mathbb{Z}; \tau \in I; v=1, \ldots, N(k, r)}.$$

By Lemma 2.4 and Definition 3.3,

$$\|S_{\tilde{D}}(g)\|_{\dot{F}^{-\alpha,q'}_{q',w'}} \leq C\|g\|_{\dot{F}^{-\alpha,q'}_{q',w'}(X)},$$

and then

$$\|\langle f, g \rangle\| \leq \|S_D(f)\|_{\dot{F}^{\alpha,q}_{q,w}} \|S_{\tilde{D}}(g)\|_{\dot{F}^{-\alpha,q'}_{q',w'}} \leq \|f\|_{\dot{F}^{\alpha,q}_{q,w}} \|g\|_{\dot{F}^{-\alpha,q'}_{q',w'}(X)}.$$

This proves that

$$\|L_g\| \approx \|g\|_{\dot{F}^{-\alpha,q'}_{q',w'}(X)}.$$
By Lemma 2.4 and Definition 3.3, we obtain
\[ \|T_D(t)\|_{\ell_t^{p,q}} \leq C \|t\|_{\ell_t^{p,q}} \leq C \|L\|. \]

Let \( g = T_D(t) \in \ell_t^{p,q} \). This completes the proof of the theorem.

\[ \square \]

4. Proof of Theorem 1.7

To prove the ‘if’ part of Theorem 1.7, we need the following lemma.

**Lemma 4.1.** Let \( S_{\alpha,q} \) be the area function defined in (1.8). Then there exists a positive constant \( C \) such that for all \((p, q, \alpha)\)-atoms \( a \),

\[ \|S_{\alpha,q}(a)\|^p_{L_w} \leq C. \quad (4.1) \]

Let us take this lemma for granted for the moment.

**Proof of Theorem 1.7.** Let \( f(x) = \sum_k \lambda_k a_k(x) \), where each \( a_k \) is a \((p, q, \alpha)\)-atom, as in Definition 1.6. From Lemma 4.1,

\[ \|f\|^p_{F_{p,w}(X)} = \|S_{\alpha,q}(f)\|^p_{L_w} \leq \sum_k |\lambda_k|^p \|S_{\alpha,q}(a_k)\|^p_{L_w} \leq C \sum_k |\lambda_k|^p. \]

Conversely, we use the construction of an approximation to the identity by Coifman, as in Remark 1.3, to obtain \( \{S_k\}_k \) on \( X \) for which there exists a constant \( C' \) such that, for all \( k \in \mathbb{Z} \) and \( x, x', y \in X \):

(i) \( S_k(x, y) = 0 \) if \( \rho(x, y) > C'_4 2^{-k} \) and \( \|S_k\|_\infty \leq C'_4 2^k \);
(ii) \( |S_k(x, y) - S_k(x', y)| \leq C'_4 2^{k(1+\varepsilon)} \rho(x, x')^\varepsilon \);
(iii) \( \int_X S_k(x, y) \, d\mu(y) = 1 \);
(iv) \( S_k(x, y) = S_k(y, x) \).

We can check that such \( \{S_k\}_k \) satisfies all the conditions in Definition 1.2. Moreover, we can see that for each fixed \( y \), when \( S_k(x, y) \) is considered as a function of \( x \), it is supported on \( \{x \in X : \rho(x, y) \leq C'_4 2^{-k}\} \). Set \( D_k = S_k - S_{k-1} \). Then we can see that similar results hold for \( D_k \) but with (iii) replaced by:

(iii) \( \int_X D_k(x, y) \, d\mu(y) = 0 \).

Substituting this \( \{D_k\}_k \) into (1.8), Definition 1.2 and Proposition 2.2, for a function \( f \in F_{p,w}(X) \), we let

\[ \Omega_k = \{x \in X : S_{\alpha,q}(f)(x) > 2^k\}, \]
\[ B_k = \{Q : w(Q \cap \Omega_k) > w(Q)/2, w(Q \cap \Omega_{k+1}) \leq w(Q)/2\}, \]
\[ \hat{\Omega}_k = \{x \in X : M(\chi_{\Omega_k})(x) > 1/2\}. \]

From Lemma 2.1, we know that for each dyadic cube \( Q \) in \( X \), there is a unique \( k \in \mathbb{Z} \) such that \( Q = Q_{\alpha_k}^k \) for some \( \alpha \in I_k \). We denote such \( k \) by \( k_Q \). Also, for each dyadic

\[ \text{https://doi.org/10.1017/S144678871000159X Published online by Cambridge University Press} \]
Atomic decomposition of weighted Triebel–Lizorkin spaces

For each dyadic cube \( Q \in B_k \), there is a unique \( k \in \mathbb{Z} \) such that \( Q \in B_k \). For each dyadic cube \( Q \in B_k \), there is a unique maximal dyadic cube \( Q' \in B_k \) such that \( Q \subseteq Q' \). Denote the collection of all maximal dyadic cubes in \( B_k \) by \( Q^*_k \), \( i \in J_k \), an index set which depends on \( k \) (it may be finite). We then have for all dyadic cubes \( Q \),

\[
\bigcup_Q Q = \bigcup_k \bigcup_{Q \subseteq Q^*_k, Q \in B_k} Q.
\]

Applying the Calderón reproducing formula (Proposition 2.2), we see that

\[
f(x) = \sum_k D_k \tilde{D}_k (f)(x)
= \sum_k \sum_{i \in J_k} \sum_{Q \subseteq Q^*_k, Q \in B_k} \int_Q D_{kQ}(x, y) \tilde{D}_{kQ}(f)(y) \, d\mu(y).
\]

To obtain an atomic decomposition, we first claim that

\[
\sum_{Q \in B_k} \int_Q 2^{kQ} |\tilde{D}_{kQ}(f)(y)|^q w(Q) \, d\mu(y) \leq C 2^{kq} w(\Omega_k), \tag{4.2}
\]

where \( C \) is a constant independent of \( k \) and \( i \).

Indeed, by (1.8) and the definition of \( B_k \),

\[
\int_{\tilde{\Omega}_k \setminus \Omega_{k+1}} S_{\alpha,q}(f)(x)^q w(x) \, d\mu(x)
\geq C \int_{\tilde{\Omega}_k \setminus \Omega_{k+1}} \sum_j \int_{\rho(x,y) \leq C_3 2^{-j}} 2^j (2^{j\alpha} |\tilde{D}_j(f)(y)|)^q \, d\mu(y) w(x) \, d\mu(x)
\geq C \sum_j \int_{\chi_j} 2^j (2^{j\alpha} |\tilde{D}_j(f)(y)|)^q \, d\mu(y) \\
\geq C \sum_{Q \in B_k} \int_Q 2^{kQ} (2^{kQ} |\tilde{D}_{kQ}(f)(y)|)^q w(Q) \, d\mu(y) \tag{4.3}
\]

On the other hand, it follows from the definition of \( \Omega_k \) that

\[
\int_{\tilde{\Omega}_k \setminus \Omega_{k+1}} S_{\alpha,q}(f)(x)^q w(x) \, d\mu(x) \leq 2^{(k+1)q} w(\tilde{\Omega}_k \setminus \Omega_{k+1}) \leq C 2^{kq} w(\Omega_k). \tag{4.4}
\]

Estimate (4.3), together with (4.4), yields (4.2).
Define
\[
\lambda_{k,i} = w(Q_i^k)^{1/p-1/q} \left\{ \sum_{Q \subset Q_i^k, Q \in B_k} \int_Q 2^k \left( 2^{k\alpha} |\tilde{D}_{kQ}(f)(y)|^q w(Q) d\mu(y) \right) \right\}^{1/q},
\]
(4.5)
\[
a_{k,i}(x) = \begin{cases} \frac{\tilde{C}}{\lambda_{k,i}} \sum_{Q \subset Q_i^k, Q \in B_k} \int_Q D_{kQ}(x, y) \tilde{D}_{kQ}(f)(y) d\mu(y) & \text{if } \lambda_{k,i} \neq 0, \\
0 & \text{if } \lambda_{k,i} = 0. 
\end{cases}
\]
(4.6)
Here \(\tilde{C}\) is a fixed constant to be chosen later, which is independent of \(k\) and \(i\).

Let us verify that each \(a_{k,i}\) is a \((p, q, \alpha)-\)atom. By (iii), we can see that each \(a_{k,i}\) satisfies (1.12). And by the construction of \(D_k\),
\[
\text{supp } a_{k,i} \subseteq \bigcup_{y \in \mathcal{Q}^k_j \cap B_k} \{ x \in X : \rho(x, y) \leq C_3 2^{-kq} \} \subset \tilde{C} Q_i^k,
\]
where \(\tilde{C}\) is a constant independent of \(x, y\) and \(Q_i^k\). This gives (1.10).

To show the size condition of each \(a_{k,i}\), we claim that
\[
\sup_{\|h\|_{F^{-\alpha,q'}_{q',w'}}(X) \leq 1} |\langle a_{k,i}, h \rangle| \leq w(Q_i^k)^{1/q-1/p}. \tag{4.7}
\]
Let us assume (4.7) first; then (1.11) follows directly from Theorem 3.5. Indeed, for all \(h\) satisfying \(\|h\|_{F^{-\alpha,q'}_{q',w'}}(X) \leq 1\), by combining (1.8), (4.5), Lemma 2.6 and Hölder’s inequality, we see that
\[
|\langle a_{k,i}, h \rangle| = \frac{\tilde{C}}{\lambda_{k,i}} \left\{ \sum_{Q \subset Q_i^k, Q \in B_k} \int_Q D_{kQ}(x, y) \tilde{D}_{kQ}(f)(y) d\mu(y), h(x) \right\} \\
\leq \frac{\tilde{C}}{\lambda_{k,i}} \sum_{Q \subset Q_i^k, Q \in B_k} \int_Q |D_{kQ}(h)(y)||\tilde{D}_{kQ}(f)(y)| d\mu(y) \\
\leq \frac{\tilde{C}}{\lambda_{k,i}} \left\{ \sum_{Q \subset Q_i^k, Q \in B_k} \int_Q 2^k \left[ 2^{k\alpha} |\tilde{D}_{kQ}(f)(y)|^q w(Q) d\mu(y) \right]^{1/q} \\
\times \left\{ \sum_{Q \subset Q_i^k, Q \in B_k} \int_Q 2^k \left[ 2^{-k\alpha} |D_{kQ}(h)(y)|^q w^b(Q) d\mu(y) \right]^{1/q'} \right\}^{1/q} \\
\leq \tilde{C} w(Q_i^k)^{1/q-1/p} \|S_{\alpha,q}(h)\|_{L^{q'}_w} \\
\leq \tilde{C} C w(Q_i^k)^{1/q-1/p} \|h\|_{F^{-\alpha,q'}_{q',w'}}(X) \\
\leq w(Q_i^k)^{1/q-1/p},
\]
where \(C\) is a constant independent of \(k\) and \(i\), and we choose \(\tilde{C}\) such that \(\tilde{C} C \leq 1\). This gives (4.7).
Finally, from (4.2), we obtain that
\[
\sum_{k} \sum_{i \in I_k} |\lambda_{k,i}|^p \\
\leq C \sum_{k} \sum_{i \in I_k} w(Q_k^i)^{1-p/q} \\
\times \left\{ \sum_{Q \subset Q_k} 2^{k \alpha} (2^{k \alpha} |D_{kQ}(f)(y)|)^q w(Q) d\mu(y) \right\}^{p/q} \\
\leq C \left( \sum_{i \in I_k} w(Q_k^i)^{1-p/q} \right) \\
\times \left[ \sum_{i \in I_k} \sum_{Q \subset Q_k} \int_Q 2^{k \alpha} (2^{k \alpha} |D_{kQ}(f)(y)|)^q w(Q) d\mu(y) \right]^{p/q} \\
\leq C \sum_{k} 2^{kp} w(\Omega_k) \\
\leq C \|f\|_{\dot{F}_{p,q,w}(X)}.
\]

This concludes the proof of Theorem 1.7, modulo the proof of Lemma 4.1, which we will give now. \(\square\)

**Proof of Lemma 4.1.** Suppose that \(\text{supp } a \subseteq B = B(z_0, r)\). Let
\[
\|S_{\alpha,q}(a)\|_{L_w^p} = \int_{\mathcal{X}} |S_{\alpha,q}(a)|^p w(x) d\mu(x) \\
= \left( \int_{2B} + \int_{(2B)^c} \right) |S_{\alpha,q}(a)|^p w(x) d\mu(x) =: T_1 + T_2,
\]
say. For the term \(T_1\), by Hölder’s inequality and (1.11),
\[
T_1 \leq \left( \int_{2B} |S_{\alpha,q}(a)|^q w(x) d\mu(x) \right)^{p/q} \left( \int_{2B} w(x) d\mu(x) \right)^{1-p/q} \\
\leq C \|a\|_{L_{p,q,w}(X)}^p w(B)^{1-p/q} \\
\leq C w(B)^{p/q-1} w(B)^{1-p/q} \\
\leq C,
\]
where \(C\) depends only on \(p\) and \(\tilde{C}\) in (4.8).

Now let us turn to the term \(T_2\). By Definition 1.8, one can write
\[
T_2 = \int_{(2B)^c} \left\{ \sum_j \int_{\rho(x,y) \leq C_3 2^{-j}} 2^j (2^{j \alpha} |D_j(a)(y)|)^q d\mu(y) \right\}^{p/q} w(x) d\mu(x). \quad (4.9)
\]
By (1.10) and the construction of $D_j$ in the proof of Theorem 1.7, we deduce that for each $j$, the function $y \mapsto D_j(a)(y)$ is supported in $\{y : \rho(y, z) \leq C_6 2^{-j}\}$, where $z \in B$ and $C_6$ is a constant independent of $j$ and $B$. In the integral in (4.9), moreover, $y$ should be in $\{y : \rho(x, y) \leq C_3 2^{-j}\}$. Hence there exists a constant $C_7$, which depends only on $C_3$ and $C_6$, such that $D_j(a)(y) = 0$ when $2^{-j} \leq C_7|x - z_0|$. So

$$T_2 = \int_{2^j < \rho(x, y) \leq 2^{-j}} |D_j(a)(y)| q(y) d\mu(y) \int_{2^j < \rho(x, y) \leq 2^{-j}} 2^j (2^{j\alpha} |D_j(a)(y)|)^q d\mu(y)$$

To estimate the right-hand side of (4.10), we first consider $D_j(a)$. By (1.10) and (1.12),

$$D_j(a)(y) = \int_X D_j(y, z)a(z) d\mu(z) = \int_X[D_j(y, z) - \psi_j(y)]\eta(y) a(z) d\mu(z),$$

where $\eta(z) = \chi_B(z)$ and

$$\psi_j(y) = \frac{\int D_j(y, z)\eta(z) d\mu(z)}{\int \eta(z) d\mu(z)}.$$

Set $h(z) = [D_j(y, z) - \psi_j(y)]\eta(y)$. Then, for all $z, z' \in B$,

$$|h(z)| \leq C 2^{j(1+\varepsilon)} \mu(B)^\varepsilon;$$

$$|h(z) - h(z')| \leq C 2^{j(1+\varepsilon)} \rho(z, z')\varepsilon;$$

$$(4.13) \int_X h(z) d\mu(z) = 0.$$

Now $h(z) = \sum_k \tilde{D}_k D_k(h)(z)$, from Lemma 2.2. Together with Hölder’s inequality, this shows that

$$|D_j(a)(y)| = \left| \int_X h(z) a(z) d\mu(z) \right|$$

$$\leq C \|a\|_{L^{q, q'}(X)} \left\{ \int_X \sum_k (2^{-k\alpha} |D_k(h)(z')|^q w^b(z') d\mu(z') \right\}^{1/q'}.$$

To estimate the right-hand side of (4.14), note that

$$\left\{ \int_X \sum_k (2^{-k\alpha} |D_k(h)(z')|^q w^b(z') d\mu(z') \right\}^{1/q'}$$

$$\leq \left\{ \int_{A^B} \sum_{2^{-k} \leq \mu(B)} (2^{-k\alpha} |D_k(h)(z')|^q w^b(z') d\mu(z') \right\}^{1/q'}$$

$$+ \left\{ \int_{A^B} \sum_{2^{-k} \geq \mu(B)} (2^{-k\alpha} |D_k(h)(z')|^q w^b(z') d\mu(z') \right\}^{1/q'}$$

$$+ \left\{ \int_{A^B} \sum_{2^{-k} \leq \mu(B)} (2^{-k\alpha} |D_k(h)(z')|^q w^b(z') d\mu(z') \right\}^{1/q'}$$

$$+ \left\{ \int_{A^B} \sum_{2^{-k} \geq \mu(B)} (2^{-k\alpha} |D_k(h)(z')|^q w^b(z') d\mu(z') \right\}^{1/q'}$$
\[ + \left\{ \int_{(4B)^c} \sum_{2^{-k} > \mu(B)} (2^{-ka} |D_k(h)(z')|)^q w^b(z') \, d\mu(z') \right\}^{1/q'} \]

say. For the term \( V_1 \), by (4.12),
\[ |D_k(h)(z')| = \left| \int_X D_k(z', x)[h(x) - h(z')] \, d\mu(x) \right| \leq C 2^{-k}\varepsilon 2^{j(1+\varepsilon)}, \]
which gives \( V_1 \leq C(w^b(B))^{1/q'} \mu(B)^{\alpha+\varepsilon} 2^{j(1+\varepsilon)}. \)

Now consider term \( V_2 \). By (4.11),
\[ |D_k(h)(z')| \leq \int_X |D_k(z', x)||h(x)| \, d\mu(x) \leq C 2^k 2^{j(1+\varepsilon)} \mu(B)^{1+\varepsilon}, \]
which proves that \( V_2 \leq C(w^b(B))^{1/q'} \mu(B)^{\alpha+\varepsilon} 2^{j(1+\varepsilon)}. \)

For the term \( V_3 \), note that \( \text{supp } h \subseteq B \) and \( 2^{-k} \leq C \mu(B) \), so \( V_3 = 0 \).

Finally, let us estimate the term \( V_4 \). By (4.13),
\[ |D_k(h)(z')| \leq \int_X |D_k(z', x) - D_k(z', z_0)||h(x)| \, d\mu(x) \]
\[ \leq C \int_B \left( \frac{\rho(x, z_0)}{2^{-k} + \rho(z', z_0)} \right)^\varepsilon \frac{2^{-k}\varepsilon}{(2^{-k} + \rho(z', z_0))^{1+\varepsilon}} 2^{j(1+\varepsilon)} \mu(B)^{\varepsilon} \, d\mu(x) \]
\[ \leq C 2^{j(1+\varepsilon)} \mu(B)^{1+2\varepsilon} (2^{-k} + \rho(z', z_0))^{1+2\varepsilon}. \]

This shows that \( V_4 \) is at most
\[ \left\{ \sum_{2^{-k} > \mu(B)} \frac{2^{j(1+\varepsilon)}q'}{2^{kaq'}} \mu(B)^{(1+2\varepsilon)q'} \int_{(4B)^c} \left[ \frac{2^{-k}\varepsilon}{(2^{-k} + \rho(z', z_0))^{1+2\varepsilon}} \right]^{q'} w^b(z') \, d\mu(z') \right\}^{1/q'}. \]

Noting that \( \mu(B) \leq \rho(z', z_0) \leq c 2^{-k} \) and \( \rho(z', z_0) \geq c 2^{-k} \), we see that
\[ V_4 \leq C(w^b(B))^{1/q'} \mu(B)^{\alpha+\varepsilon} 2^{j(1+\varepsilon)}. \]

Combining (4.14) and the estimates of \( V_1, V_2, V_3 \) and \( V_4 \), we obtain
\[ |D_j(a)(y)| \leq C w(B)^{1/q-1/p} (w^b(B))^{1/q'} \mu(B)^{\alpha+\varepsilon} 2^{j(1+\varepsilon)}. \] (4.15)

Substituting (4.15) back into (4.10), and using Lemma 2.6, we see that
\[ T_2 \leq w(B)^{p/q-1} (w^b(B))^{p/q'} \mu(B)^{(\alpha+\varepsilon)p} \]
\[ \times \int (2B)^c \left\{ \sum_{2^{-j} < \mu(x, z_0)} 2^{j(1+\varepsilon+\alpha)q} \right\}^{p/q} w(x) \, d\mu(x) \]
\[ \leq C \mu(B)^{(1+\alpha+\epsilon)p} \frac{w(x)}{\rho(x, z_0)^{(1+\epsilon+\alpha)p}} d\mu(x) \leq C. \]

Our estimates of \( T_1 \) and \( T_2 \) yield (4.1), and the proof of Lemma 4.1 is complete. \( \square \)
