**Abstract:** A summary of less than 200 words communicating the primary findings and significance of the research.

**Key words:** Up to five words for the purposes of indexing, which are not included in the abstract.

**Introduction:** State the relevant background to the study to provide the reader with context to enable non-specialists to appreciate the objectives and significance of the paper.

**Objective:** A single paragraph stating the hypothesis to be tested, or the observation or measurement to be made, and the methodological approach that will be taken to achieve the aims.

**Methods:** Materials and procedures should be described in sufficient detail to enable replication. Results should not be included in the Methods section. This section should be brief but provide sufficient information to permit others to repeat the study. Pertinent details of species, apparatus and equipment, procedures and experimental design should be described. All experiments involving human subjects must be conducted in accordance with principles embodied in the Declaration of Helsinki (Code of Ethics of the World Medical Association). Experiments involving animal subjects must conform to the principles regarding the care and use of animals adopted by the American Physiological Society and the Society for Neuroscience. The Editor may refuse papers that provide insufficient evidence of adherence to these principles.

**Results:** This section may contain subheadings. Authors should indicate what data are included in the results. The results should be presented clearly and concisely, using Figures and Tables to summarize or illustrate the important findings.

**Conclusions:** The main conclusions that can be reached directly and unambiguously from the results should be included in one to four sentences in outline form. Each conclusion is stated as a declarative sentence in a bulleted paragraph, with one sentence for each conclusion. These are a simple statement by the author of the facts that have been obtained from the results, without any interpretation, extrapolation, or qualification.

**Discussion:** Interpretation of the conclusions with respect to the hypothesis and the significance to the field should be discussed. Considerable care should be taken to avoid the confusions for conclusions and alternative interpretations, and the differences or resolution in the field is encouraged. Limited speculation and directions for future research can be included.

**Acknowledgements:** Use a separate page to recognize the contributions of individuals and supporting institutions.

**References:** The Harvard style (author-date) system should be used in the text and a complete list of References cited given at the end of the article. Unpublished communications, and manuscripts submitted for publication should be cited in the text and the supporting material submitted with the manuscript. In a text citation of a work by more than three authors, cite the first author's name followed by et al. (but name the authors of the first author's name should be given in the References section). In the text, references should be cited in the following style: Hagg (2001); (Stevens, 2001); (Sanes & Schellere, 1997; Chalal, et al., 2002). The alphabetical list of references in each new page, and must be typed double-spaced. Each in-text citation must have a corresponding reference and vice versa. Lists will be different authors who are cited in the same parentheses in chronological order, beginning with the earlier work. Journal titles should not be abbreviated. Only published articles and articles in press should appear in this list. Responsibility for the accuracy of references cited lies with the authors. If the Digital Object Identifier (DOI) is known, it can be given at the end of the citation entry.

**Examples:**

- **Journal article**
  - Book
  - Book
  - Work in press
  - As above, but no year of publication or volume number.
  - Book
  - Thesis
  - Try to avoid citing these in the main text – cite peer-reviewed primary publications instead.
  - Abstracts
  - Try to avoid citing these in the main text – cite peer-reviewed primary publications instead.
