*DNA Topology and Its Biological Effects*, Monograph 20. Edited by NICHOLAS R. COZZARELLI and JAMES C. WANG. Cold Spring Harbor Laboratory 1990. 480 pages. Price \$97. ISBN 0 87969 348 7.

This book is the newest addition to the high quality series of monographs published by the Cold Spring Harbor Press and is no exception to this standard. The first half of the book deals with DNA structure and supercoiling and the second half with the enzymes that change its topology, the topoisomerases, and their effects. The subject area is central to the understanding of almost all DNA interactions (e.g. transcription, replication, recombination and chromosome organization) a pivotal role that is underlined by the effectiveness of topoisomerase inhibitors as anti-cancer drugs. The chapters are written by widely respected experts in the field and the book as a whole constitutes a welcome resource for many whose work impinges upon this area and a window into a marvellous world of coils and supercoils for anyone who just finds this subject fascinating. In the preface, the editors state that 'The organisation of this volume was designed to provide a structured introduction to the uninitiated ... and that the authors had been asked to write their chapters 'in a didactic style, operating on the assumption that the average reader would have little prior knowledge of the subject'. This is rather a tall order when also attempting to make each chapter 'a separate unit for the more advanced' in an area as intellectually challenging as this. From my point of view as a geneticist with an interest in this area I was interested to see how well they had succeeded in their goals and this review can be viewed as 'a geneticist's perspective'.

The book starts by introducing the structures of DNA, emphasising the knowledge that we now have from a variety of methods of the effect of sequence on structure. I found this section fascinating but not easy to follow and I would have appreciated a more gentle introduction to the definitions of twist, roll and slide at an earlier stage in the first chapter. The book then goes on to discuss the bending of DNA in nucleoprotein complexes and in loops that regulate gene expression. These chapters interweave the experimental evidence with theoretical work and illustrate the subject with examples to produce a clear picture. The only part that I had difficulty with was the 'linking number paradox' which was clarified in the later chapter on the topology and geometry of DNA supercoiling. To my mind, the chapter dealing with the topology and geometry of DNA supercoiling was

the high point of the book. This chapter takes the novice through the intricacies of linking number, twist and writhe to newer parameters such as surface twist and surface linking number without assuming any prior knowledge or advanced mathematical skills. I do not want to imply that the chapter makes for easy reading; it is very challenging. But to retain rigour while making the subject accessible is a superb achievement; congratulations. Unfortunately I cannot say the same thing about the chapter on DNA supercoiling and unusual structures. Here the theoretical treatment is not accessible without specialist knowledge outwith the coverage of the book, and the treatment of the experimental work on cruciforms and Z DNA is rather limited. The chapters of the book that cover the topoisomerases are more descriptive and therefore not so intellectually challenging. Type-I and Type-II topoisomerases of prokaryotic, eukaryotic, archbacterial and viral origin are described in eloquent detail as are their effects on replication and illegitimate recombination; and the book ends with a section on the natural modification of topoisomerases and the effects of drugs that interact with topoisomerases and their use in the treatment of cancer. An appendix giving the nucleic acid and encoded amino acid sequences of topoisomerase genes completes the picture.

As a whole I believe that the book succeeds very well and will allow the non-specialist to enter into the world of coils and supercoils but also does not sacrifice the rigour required to be of value to the scientist working in this area. Because of my own interests I would have liked to have seen a section on site-specific recombination where such remarkable applications of topological principles have been made to understand the organisational level of the reaction mechanisms. But as the editors say in the preface they have not been 'exempted from the usual perils associated with the publication of a book on a rapidly evolving subject'. In fact they have done remarkably well in avoiding these perils and have put together a book that I can recommend very highly.

This volume presents 14 articles based on talks given at a meeting on 'In situ hybridization' in Edinburgh in April, 1989. In situ hybridization uses labelled nucleic acid probes to detect specific RNA or DNA sequences within chromosomes, cells and tissues. This powerful
