

Conceptions of *Shari`a* and Support for Militancy and Democratic Values: Evidence From Pakistan*

C. CHRISTINE FAIR, REBECCA LITTMAN AND ELIZABETH R. NUGENT

Numerous empirical studies of the relationship between popular support for Islamism and support for democracy and violence have yielded inconclusive results. We suspect that this is largely because scholars have not operationalized support for *shari`a* in ways that capture the concept's multi-dimensionality. In this paper, we employ data derived from a carefully designed survey instrument that casts unique insights into how Pakistanis imagine a *shari`a*-based government. We find that formalizing an Islamic government as one that implements *shari`a* by providing services and security for its citizens is positively associated with support for democratic values, whereas conceptualizing it as one that implements *shari`a* by imposing *hudud* punishments and restricting women's public roles is positively associated with support for militancy. These results suggest that it is important to understand how individuals within a particular context construe a *shari`a*-based government, and future empirical work should take this.

Scholars and policy analysts have sought to understand the relationship between popular support for Islamism, and political preferences such as support for democratic politics and Islamist militancy. Empirical studies testing these relationships have been inconclusive, either showing no significant relationship or presenting contradictory findings (e.g., Tessler and Nachtwey 1998; Norris and Inglehart 2002; Haddad 2003; Fair, Ramsay and Kull 2008; Jamal and Tessler 2008; Kaltenthaler et al. 2010; Tessler, Jamal and Robbins 2012). In this paper, we argue that these discordant empirical findings derive from vexatious challenges in measuring support for *shari`a* in quantitative models. Scholars, usually forced to rely on existing data sets, tend to measure support for Islamism, defined as an ideology that locates political legitimacy in the application of the *shari`a*, rather than specifying the meaning of this support because existing surveys tend not to ask respondents what *shari`a* means to them.¹ Consequently, extant scholarship generally has not fully characterized respondents' interpretation of *shari`a* because analysts use variables that either reflect abstract patterns of support for a combination of religion and politics or, alternatively, support for very specific aspects of *shari`a*. We argue that these partial operationalizations limit accurate measurement of important variation in respondents' interpretations of *shari`a*, which in turn affects scholar's ability to accurately posit a relationship between support for certain interpretations of *shari`a*, and support for democracy and Islamist violence.

In this paper, we attempt to make modest but important improvements in this scholarship by leveraging unique survey data that permit us to more robustly characterize the relationship between support for Islamism, and support for democracy and Islamist violence. We begin from the observation that a more accurate exposition of these relationships depends on an appreciation of the multi-faceted nature of *shari`a* and concomitant operationalization of the concept.

¹ This definition of Islamism was originally used in Jamal, Masoud and Nugent (2014).

The larger concept of Islamism, defined as the political implementation of *shari`a* in legitimizing legislation and governance, contains within it much variation in how to define *shari`a*, including which aspects to emphasize and which individual or sectarian interpretation to implement. Thus, we argue for enhanced attention to exposing respondents' varied beliefs about *shari`a* as a means to more accurately operationalize Islamism and as a necessary precursor for measuring its support. Specifically, we examine how varying conceptualizations of an Islamic government, defined as one guided by *shari`a*, relate to support for democratic values and support for Islamist militant groups among survey respondents in Pakistan. We focus on Pakistan, a predominantly Muslim country of over 196 million persons, because it is an extremely important country of study for both policy and epistemological reasons due to its checkered history of democracy and complex relationship with Islamism. Pakistan contains tremendous geopolitical relevance; it both uses Islamist militancy and nuclear coercion as tools of foreign policy, and has itself been a victim of Islamist terrorism, principally due to blowback from its erstwhile proxies (Fair 2014; Paul 2014). Epistemologically, understanding the ties between conceptualizations of *shari`a* governance and political preferences with respect to democracy and Islamist violence in Muslim countries remains an important topic of scholarly inquiry.

To empirically address the challenges posed by the complex concept of *shari`a*, we employ data derived from a carefully designed survey instrument that offers unique insights into how Pakistanis define a *shari`a*-based government. Employing these data to conduct confirmatory principal component factor analysis, we identify two distinct components of *shari`a* government in Pakistan: a transparent and fair government that provides for its citizens, and a government that imposes Islamic social and legal norms. We find that conceptualizing an Islamic government as one that implements *shari`a* by providing services and security for its citizens is associated with increased support for democratic values, whereas conceptualizing an Islamic government as one that implements *shari`a* by imposing *hudud* punishments (physical punishments such as whipping, stoning, cutting off hands, etc.) and restricting women's public roles is associated with increased support for militancy. This result demonstrates that the relationship between Islamism and other preferences largely depends on how individuals within a particular context and time period construe a *shari`a*-based government, and that Islamism is only an ideology associated with either democracy or violence when an individual defines it as such. Our findings also imply that future survey work on related topics should account for this complexity by more adequately capturing the multidimensionality of *shari`a* in fielded survey instruments.

The remainder of this paper is organized as follows. We first highlight the theoretical ambiguity and measurement challenges in how scholars have previously operationalized Islamism and support for *shari`a*. We then provide background on the history of Islam and politics in Pakistan, the context of our study, and outline our approach to more accurately conceptualize support for *shari`a* that captures its multi-faceted and often contradictory nature. Next, we describe our data and empirical strategy, and turn to the results. We then discuss the implications of our analysis for the ways in which overly broad definitions of political concepts in surveys can mask important complexities and frustrate attempts to understand the ways in which these concepts relate to other politics preferences. We conclude with a discussion of the implications of these findings for future research and for policy.

SUPPORT FOR *SHARI`A*: MEASUREMENT ISSUES

Shari`a is difficult to define and operationalize due to the significant pluralism that exists within any religious tradition, resulting in two innate divergences. The first divergence occurs between text and practice. Redfield (1956, 70) articulates this as a division between a religion's "great"

and “little” traditions. The “great” tradition is the orthodox, textual, “consciously cultivated and handed down” tradition, while the “little” tradition can be described as heterodox, local, and popular, varying across groups and even individuals that may be considered part of the same larger faith tradition. This is not unique to Islam; all major world religions encompass both a written component as well as a varied practiced component. A second divergence occurs between the practiced traditions of religion. Practiced religion differs significantly across geographic and political contexts, within different sects, and even across individuals within any of these given contexts (Geertz 1971; Lukens-Bull 1999). In order to capture these divergences in one term encompassing all possible permutations of a religious tradition, Asad (2013 [1986]) argues that Islam is a “discursive tradition.”² Asad argues that any practices which relate themselves to the religious discursive tradition, however, this relationship is manifested, should be considered part of that religion.

Implicit in this description is the idea that while these varied practices draw legitimacy from the same discursive tradition, lived and practiced religious tradition will be heterogeneous and possibly contradictory across Muslims in different times, places, and communities. This multiplicity of practiced Islams has implications for defining *shari`a* and Islamism in empirical work. The meaning of the term *shari`a* has changed over time in both scholarship as well as in practice, from a type of legal training and learning process, to the institutionalization of specific Islamic legal institutions, to a more narrow approach limited to implementing specific and identifiably Islamic legal rules derived from the *Qur`an* and the *Sunnah* (Brown 1997). Even the narrower contemporary definition of *shari`a* differs across contexts and actors. Various definitions of *shari`a* draw from any combination of prescriptions outlined in the *Qur`an* and the *Sunnah* related to larger societal issues of politics, economics, justice, and social organization, in addition to personal issues such as sexual intercourse, hygiene, diet, and prayer (Schwedler 2011). The complexities arising from the translation of a multiplicity of practiced and interpreted Islams is manifested in the diverse range of actors that can be described as Islamist, extending from those that advocate for quietism, effecting gradual political change through internal individual reform, to political parties advocating for societal reform through social welfare and electoral contestation, to revolutionary jihadis that seek to overthrow illegitimate states and implement revolutionary change. Islamists range from those who root justifications of their behavior in personal and literalist interpretation of the textual tradition, to those who rely on interpretations derived from human independent reasoning and decision making with a firm basis in established schools of Islamic legal theory. As such, there is little agreement among Muslims as to how a society based on Islamic law should be organized and governed (Kramer 1993).

Due to these theoretical complexities, scholars have faced difficulties in operationalizing support for *shari`a*. Many studies aiming to capture respondents’ support for Islamism rely upon selective or stylized measurements of the underlying concept. Some scholars rely upon a general pattern of support for a combination of religion and politics, while others use very specific facets of Islamic law, rather than capturing the respondent’s personal definition or interpretation *shari`a*. For example, in a sample of Lebanese citizens, Haddad (2003) measures support for political Islam through a variable that combines a respondent’s support for militant violence, support for religious leaders holding public office, the perception of the Islamic state as the best political model, and the separation of religion and politics.³ Muluk, Sumaktoyo and Ruth (2013) measure support for Islamic law through a variable combining the respondent’s

² Though he frames his critique with particular reference to Islam, Asad’s observations apply to all major religious traditions.

³ Haddad and Khashan (2002) use the same instrument and a similarly constructed variable.

agreement with the following statements: an appropriate punishment for thieves is hand cutting, a woman cannot be president, it is inappropriate to wish Christians a “Merry Christmas,” people committing adultery must be stoned to death, and Muslims who convert to other religions must be killed. Tessler (2002) employs multiple definitions of support for Islamic guidance in public affairs, drawing from varying survey instruments implemented in different Arab Muslim countries. One such operationalization includes the respondent’s opinion on whether men of religion should have a leading role in politics, agreement that Islam is the sole faith by which Palestinians can obtain their rights, and whether the respondent supports Islamic political parties and the establishment of an Islamic caliphate state. A second measurement used by Tessler asks whether religion should guide political, administrative, economic, and commercial affairs.⁴ These studies under-specify or even mis-specify *shari`a*, because quantification of support for the concept does not incorporate its multi-dimensional and subjective nature (Sartori 1970).

In many instances, it appears that scholars are instrumentalizing support for *shari`a* using sub-optimal variables; scholars tend to do this when their choice of variables is limited to items on cross-national surveys that best proxy the concepts they wish to measure.⁵ As we have noted above, a common baseline definition exists in academic explorations and practiced versions of Islamism: an ideology that assigns Islamic law a predominant role in legitimizing legislation and governance through the political implementation of the *shari`a*. Yet, because *shari`a* can cover a number of definitions and practices that vary across individuals, it is important to define and measure this term precisely—and in order to do so, scholars must ask surveyed populations what the concept means to them before they ask whether they support it. In the following sections, we outline a process through which we attempt to improve upon current methods of defining and measuring support for Islamism and *shari`a* in the specific context of Pakistan, in order to better characterize its relationship with important—and opposing—political preferences.

CONCEPTUALIZING SUPPORT FOR *SHARI`A* IN PAKISTAN

Pakistanis have debated the meaning of *shari`a* and what role it should have in the state since the country’s founding in 1947 (Rizvi 2000; Haqqani 2005; Qadeer 2005; Shaikh 2009). While Pakistan’s leaders relied upon Islamism for state-building purposes, they never articulated a definition of *shari`a* principally due to the plurality of interpretative traditions of Islam (*masalik*, plural of *maslak*) embraced by the polity. In addition to the *Shr`ah maslak*, which itself has multiple sects, there are four Sunni *masalik*: *Bar`elwī*, *Deobandi*, *Ahl-e-Hadith*, and *Jamaat-e-Islami* (which is also a political party that purports to be supra-sectarian). Each *maslak* has its own definition of *shari`a* and looks to different sources of Islamic legitimacy. With the exception of *Ahl-e-Hadith*, which follows no school of jurisprudence (*fiqh*), all Sunni *masalik* in Pakistan follow the Hanafī *fiqh*, despite other sources of differences and even (sometimes violent) disagreement (Rahman 2004; Abou Zahab 2009; Reetz 2009). Apart from state-led forms of Islamism, Pakistan’s multifarious Islamist actors (i.e., political parties and militant groups) offer competing interpretations of *shari`a* (Shah 2003; Fair 2011; International Crisis Group 2011). The multiplicity of competing interpretations of *shari`a* has posed very real constraints on any meaningful implementation in Pakistan (Haqqani 2005; Shaikh 2009).

⁴ Two additional measurements capture the respondent’s support for various definitions of secularism, support for the religions “awakening” now current in society, and organized religious movements; and the extent to which respondents agree with the statement, “Our country should always be guided by Islamic law and values.” Tessler and Robbins (2007) rely on similar survey items.

⁵ In many cases, this is because scholars rely upon readily available survey data which do not query respondents about what they believe *shari`a* to be, but rather ask them about support for presupposed categories.

Defining Shari`a in Pakistan

While Pakistanis consistently demonstrate high levels of support for *shari`a* in surveys (Pew Research Center 2012; Pew Research Center 2013), these surveys generally fail to adequately discern what Pakistanis believe *shari`a* to be. To cast light on this issue, Fair, Malhotra and Shapiro (2010) fielded a survey that included a battery of questions to elucidate how Pakistanis conceptualize *shari`a* and how they view the role of Islam in their state. Respondents were first asked, "How much do you think Pakistan is governed according to Islamic principles?". Respondents were quite divided on this issue: nearly one-third thought that Pakistan was governed "completely" or "a lot" by Islamic principles, one-half believed that it was governed "a moderate amount" or a "little," and 20 percent thought it was not governed at all by Islamic principles. Additionally, the vast majority of respondents (69 percent) indicated that *shari`a* should play either a "much larger role" or a "somewhat larger role." Only 20 percent thought it should play "about the same role," and fewer than 10 percent believed that it should play "a somewhat" or a "much smaller role." That survey also included a battery of questions about *shari`a* to identify the components that Pakistanis include in this concept. More than 95 percent of respondents believed a *shari`a* government is one that provides services, justice, personal security, and is free of corruption. In contrast, 55 percent believed that a *shari`a* government is one that uses physical punishments. Given the generally positive attributes that respondents ascribe to *shari`a*, it is not surprising that the minority see Pakistan as being governed under those principles and that they would like a greater role for *shari`a*.

Pakistanis are not alone in characterizing an Islamic government in terms of good governance. In Afghanistan, one of the most important aspects of the Taliban's operations is the provision of justice and ongoing efforts to delegitimize the Afghan government based upon its pervasive corruption. In fact, many ordinary Afghans have come to support the Taliban because of the corruption that they observed in the government (Abdul-Ahad 2008). Collins (2007) finds similar motivations among Islamists and their supporters in the Caucasus and Central Asia, and a 2008 Gallup poll found that Muslims living in Egypt, Iran, and Turkey believe that *shari`a* promotes the rule of law and justice (Rheault and Mogahed 2008). Thus, this notion of a *shari`a*-based polity as one that is based upon good governance appears to hold in some form or another well beyond Pakistan.

The results from this earlier Pakistan survey suggest that at least two components—a person's general preference for good governance, and a demand for a legal regime based on *Qur`anic* principles of justice and punishment—are salient dimensions of *shari`a* in Pakistan and should be incorporated into its definition when devising a measurement of support for *shari`a*. We do not claim that these two components are universal in defining support for *shari`a* (although the concept of *shari`a* as good governance resonates in other contexts as well); indeed, it is most likely impossible to provide a universal understanding of the concept across the variegated polities in the Muslim world based on the above cited theories of religion and politicized religion. However, when we ask for definitions within a specific country, we do see systematic agreement about the components of *shari`a* within the limited boundaries of a community. The combination of extensive knowledge of the context and a carefully designed survey instrument provides the information necessary to address important measurement issues in defining and operationalizing support for *shari`a* within the Pakistani context.

Expectations Regarding Support for Shari`a and Other Political Preferences

The foregoing discussion about the definition of *shari`a* in the case of Pakistan prompts questions about the relationship between various cognitions about *shari`a* and important

political preferences such as democracy on the one hand and support for Islamist militancy on the other. Existing empirical studies testing the relationship between support for Islamism and support for democracy and militancy generally find no significant consistent relationship (Norris and Inglehart 2002; Fair, Ramsay and Kull 2008; Jamal and Tessler 2008; Kaltenthaler et al. 2010; Tessler, Jamal and Robbins 2012).

In terms of the relationship between *shari`a* and democracy, several scholars have empirically tested whether various notions of *shari`a* influence political culture, as suggested by early scholars of the Muslim world (Tessler 2002). Norris and Inglehart (2002) test Huntington's "clash of civilizations" hypothesis using data from the World Values Survey to examine the effects of Judeo-Christian and Islamic religious legacies on cultural values. They find that the starkest differences are in terms of attitudes about gender norms and equality, not support for democracy (which is high across all surveyed populations). Jamal and Tessler (2008), using first wave Arab Barometer data, show that respondents who favor secular versus an Islamic-based democracy exhibit similar levels of support for important aspects of democratic political culture such as pluralism and tolerance. Similarly, Tessler, Jamal and Robbins (2012) find that both supporters and opponents of Islamism surveyed in the second wave of the Arab Barometer report high levels of support for democracy and democratic processes. To summarize, the existing literature does not demonstrate empirically a consistent pro- or anti-democratic effect of support for *shari`a*.

Similarly, scholars have studied the relationship between support for *shari`a* and support for Islamist political violence and have yielded discordant results. Some scholars have argued that while the relationship between religion and militancy is complex, religion can promote violence (Wellman and Tokuno 2004). Islam draws considerable attention because it is viewed as being particularly prone to violence.⁶ Yet, as with the literature on preferences for democracy reviewed above, empirical investigations of this relationship yield varying conclusions. Scholars analyzing the relationship between individual support for Islamism and terrorism generally find no significant relationship. For example, in a sample of Pakistanis from 2007 and 2009, Kaltenthaler et al. (2010) find that individual beliefs about the extent to which Islam should play a more influential role in the world are unrelated to attitudes about the legitimacy of terrorist attacks on civilians. Additionally, a study in Pakistan by Fair, Ramsay and Kull (2008) found no relationship between views on *shari`a* law and support for violence. However, scholars who stretch the concept of support for Islamist militancy to include more generalized anti-American and anti-Israeli sentiments generally have found that support for Islamism is associated with anti-American and Israeli sentiment (Tessler and Nachtwey 1998; Haddad and Khashan 2002; Haddad 2003; Kaltenthaler et al. 2010; McCauley 2012).

The conflicting findings of the relationship between support for *shari`a* and democracy as well as between *shari`a* and support for Islamist violence may be due to the way that support for *shari`a* is operationalized in these studies. If scholars' measurements of *shari`a* fail to capture multiple dimensions that may relate to political preferences like democracy and militancy in opposite ways, they may not observe important relationships between *shari`a* and other preferences.

Returning to the particular case of Pakistan, we find that Pakistanis have two distinct—but sometimes overlapping— notions of *shari`a*: one of a government that provides and one of a

⁶ For example, Jackson (2007) observes that scholarly discourse on the subject of Islamic terrorism tends to follow the "core narrative" that violence is motivated largely by religious beliefs rather than politics or ideology. Using the ongoing Palestinian–Israeli conflict as a case study, Weinberg, Pedahzur and Canetti-Nisim (2003) find that the majority of suicide bombers have been religiously devout persons who belonged to Hamas and Palestinian Islamic Jihad, both Islamist organizations.

government that imposes. In light of the foregoing discussion of measurement issues in extant studies, these two understandings of *shari`a* give rise to two testable hypotheses about the relationship between conceptualizations of *shari`a* and support for democratic politics and Islamist militancy.

First, we hypothesize that conceptualizing a *shari`a*-based government as one that provides good governance will be positively related to support for democracy.

HYPOTHESIS 1: Respondents who understand a *shari`a*-based government to be one that provides transparent services, justice, and personal security are more likely to support democracy.

While amenities such as transparency, justice, and personal security can be provided by non-democratic regimes, these preferences are most consistent with procedural aspects of democracy offered by Dahl (1982) and later adumbrated by Schmitter and Karl (1991).

In 1982, Robert Dahl proffered several, generally accepted “procedural minimal” conditions that must be present for modern political democracy. These include stipulations such that constitutionally elected officials exert control over government decisions; citizens elect these officials in frequent, fairly conducted elections characterized by little or no coercion; there exists nearly complete adult franchise; citizens can freely express themselves without fear of retribution; citizens can pursue alternative sources of information, which exist and are legally protected; and that citizens have the right to form independent associations including political parties and interest groups (Dahl 1982, 11). Schmitter and Karl (1991) augmented this list with two additions, namely popularly elected officials must be free to exercise their constitutional powers without interference from unelected officials (i.e., military officers, entrenched civil servants, or state managers) and the polity must be self-governing and capable of acting independently. These procedural qualifications are salient in Pakistan where the military and the bureaucracy have directly or indirectly controlled the country since the mid-1950s. Despite these developments, Pakistanis nonetheless retain a preference for democratic forms of governance (Jalal 2007; Shah 2014).

Our second hypothesis contends that conceptualizing a *shari`a*-based government as one that imposes Islamic legal and social norms will be associated with greater support for Islamist militancy.

HYPOTHESIS 2: Respondents who understand a *shari`a*-based government to be one that imposes *hudud* punishments and restricts the role of women in public are more likely to support Islamist militant groups.

We posit this relationship because many Islamist militant organizations based in or operating from Pakistan embrace *hudud* punishments. For example, the Afghan Taliban, a long-standing Pakistan ally with sanctuary in Pakistan with whom Pakistani militant groups have collaborated since their inception in the early 1990s, were in power in Afghanistan and established a *shari`a* government based upon their *Deobandi* interpretation of *shari`a*. The Afghan Taliban, both in and out of power, have used *hudud* ordinances inclusive of stoning adulterers to death, whipping men and women who do not wear “Islamic” dress, and punishing men who shave their beards, among other physical punishments for such ostensible crimes. The Sipah-e-Sahaba-e-Pakistan (SSP, also known as Lashkar-e-Jhangvi or, more recently, Ahl-e-Sunnat wal Jamaat) and allied groups use similar rationale to kill *Shi`ah*, *Bar`elwīs*, and *Ahmadīyyahs* as well as non-Muslims arguing variously that they are hypocrites (*munaḥiqin*), apostates

TABLE 1 *Descriptive Statistics*

	Mean	SD	Observations
Demographic variables			
Male	59.9%	—	16,279
Urban	32.4%	—	16,279
Head of household	39.7%	—	16,237
Able to read	55.4%	—	16,152
Able to perform arithmetic	80.3%	—	15,236
Age	35.27	12.24	16,237
Formal education level (0–6)	1.70	1.72	16,101

(*muratid*), polytheists (*mushrakin*), and non-believers (*kufar*), all of whom should be killed (Lashkar-e-Jhangvi 2008). Ostensibly, if one rejects *hudud* punishments as legitimate elements of *shari'a*, one should also be disinclined to support the Islamist militant groups that embrace these punishments.

DATA AND ANALYTICAL METHODS

To expand upon the exploratory *shari'a* definition findings of Fair, Malhotra and Shapiro (2010) and to better understand how different conceptualizations of *shari'a* government relate to support for democratic values (Hypothesis 1) and Islamist militancy (Hypothesis 2) in Pakistan, the research team fielded a face-to-face survey with a sample of 16,279 people. This included 13,282 interviews in the four main provinces (Punjab, Sindh, Balochistan, and Khyber Pakhtunkhwa), as well as 2997 interviews in six of seven agencies in the Federally Administered Tribal Areas, or FATA (Bajaur, Khyber, Kurram, Mohmand, Orakzai, and South Waziristan). The survey was fielded in January and February 2012 in the four main provinces and in April 2012 in the FATA, an area that is home to numerous active militant insurgencies. Descriptive statistics of the sample are presented in Table 1. (For more details about the design and fielding of this survey, see appendix 1 in Fair et al. 2016).

Defining a Shari'a-Based Government in Pakistan

The survey instrument included a battery of six items aimed at developing nuanced understanding of respondent beliefs about a *shari'a*-based government in Pakistan. The instructions read, "Here is a list of things some people say about *shari'a*. Tell us which ones you agree with." The enumerator then asked the respondent whether he/she agreed or disagreed that *shari'a* government means:

- A government that provides basic services such as health facilities, schools, garbage collection, road maintenance.
- A government that does not have corruption.

TABLE 2 Rotated Factor Loadings for Shari`a Items

Variables	Factor 1	Factor 2	Uniqueness
Provides services	0.4829	0.1548	0.7429
Non-corrupt	0.7595	-0.0461	0.4211
Provides security	0.7294	-0.0213	0.4675
Provides justice	0.7345	0.0105	0.4605
Physical punishments	0.0629	0.8023	0.3523
Restricts women’s role	-0.0828	0.8031	0.3482

Note: The shading indicates the specific variables that load onto the two factors.

- A government that provides personal security.
- A government that provides justice through functioning non-corrupt courts.
- A government that uses physical punishments (stoning, cutting off hands, whipping) to make sure people obey the law.
- A government that restricts women’s role in the public (working, attending school, going out in public).

These questions were intended to capture two distinct components of a *shari`a*-based government: one that conceptualizes *shari`a* as a non-corrupt government that provides services, security, and justice for its citizens, and one that conceptualizes *shari`a* as imposing punitive interpretations of Islamic legal and social norms. To test whether this is indeed the case, we conducted a confirmatory principal components factor analysis. As shown in Table 2, the factor analysis revealed that the *shari`a* questions do in fact load onto two distinct factors, which we refer to as “provides” and “imposes,” respectively. The “provides” factor accounts for 31.5 percent and the “imposes” factor accounts for 21.9 percent of the total variance, respectively. (For details of the factor analysis, see Online Appendix 1.)

We created two index variables representing these factors, rescaled to range from 0 to 1. “Provides” captures the respondent’s support for defining a *shari`a*-based government as one that is free from corruption and provides services, personal security, and justice. “Imposes” captures the respondent’s support for defining a *shari`a*-based government as one that implements *hudud* punishments and restricts women’s role in public.

Figure 1 shows the percentage of respondents who report agreeing that each item is a component of *shari`a* government. The vast majority of respondents agree that a *shari`a* government is one that provides security, justice, and basic services, and is non-corrupt. Over half of respondents, agree that a *shari`a* government is one that uses physical punishment to make sure people obey the law, and slightly less than half agree that a *shari`a* government is one that restricts women’s role in the public sphere. Men and respondents who pray *tahajjud namaz*⁷ were more likely to conceptualize a *shari`a*-based government as imposing punitive interpretations of Islamic legal and social norms ($p = 0.000$ for both), while those in urban areas and more educated respondents were less likely to endorse this view ($p = 0.009$ and $p = 0.015$, respectively). As shown in Figure 1, the mean of the “provides” index is 0.89 (SD = 0.21) and the mean of the “imposes” index is 0.52 (SD = 0.402).

At the individual level, viewing a *shari`a* government as one that provides for the people and as one that imposes punitive interpretations of Islamic legal and social norms is not zero-sum.

⁷ This prayer is not required for all Muslims. This prayer is offered after *Isha* (the compulsory nightly prayer) and before *Fajr* (the required morning prayer). We queried about practice of this prayer because it is a measure of particular piety given that it is not compulsory and requires one to wake between *Isha* and *Fajr* to offer it.

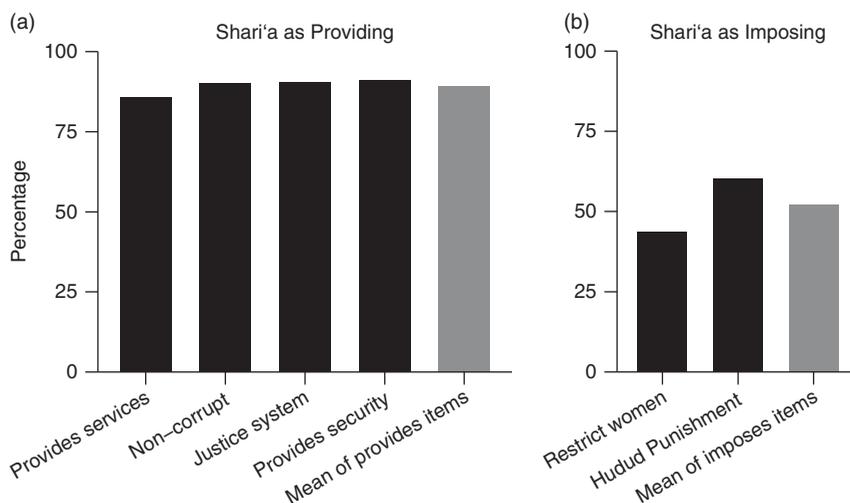

Fig. 1. Item-wise support for shari'a indices

Instead, many respondents seem to hold both views at the same time. We bin respondents by their scores on both the “provides” and “imposes” indices (high = above the median, low = below the median; see Online Appendix 1: Table 4).⁸ Nearly half of respondents are above the median on “provides” and below the median on “imposes,” while another quarter of respondents are above the median on both. Only 7.85 percent of respondents are below the median on both indices, suggesting that these two definitions do capture how most Pakistanis conceive of a *shari'a*-based government.

EMPIRICAL ANALYSIS AND RESULTS

Shari'a and Support for Democratic Values

We use responses to six questions to assess respondent support for democratic values, following Freedom House (2011) and Fair, Malhotra and Shapiro (2013).⁹ These items tap into important procedural and ideological components central to the concept of democracy.¹⁰ While the concept of democracy is also complex and may be multi-faceted, a factor analysis confirms that the questions in this particular index capture a unidimensional concept of democratic values in Pakistan (see Online Appendix 2: Tables 1–2). We combined the six democracy questions into an index, scaled from 0 to 1. As shown in Figure 2, support for democratic values is high in this

⁸ Note that because such a high percentage of the sample conceptualizes a *shari'a* government as one that provides for its citizens, a respondent falls below the median on the provides index if they do not agree with all four statements equating *shari'a* with elements of good governance. Additionally, a respondent falls below the median on the imposes index if they do not agree with both statements about imposing physical punishment and restricting women's role in public.

⁹ As Munck and Verkuilen (2002) note there is no broadly agreed upon means to measure freedom or democratic. We use the measurement approach adopted by Fair, Malhotra and Shapiro (2013) to focus upon those institutional features that, generally, are uncontested parts of the institutional package of democracy (as formulated by Freedom House and other such organizations).

¹⁰ See Online Appendix 2 for the battery of questions used to operationalize this democracy variable. See also Fair, Malhotra and Shapiro (2013).

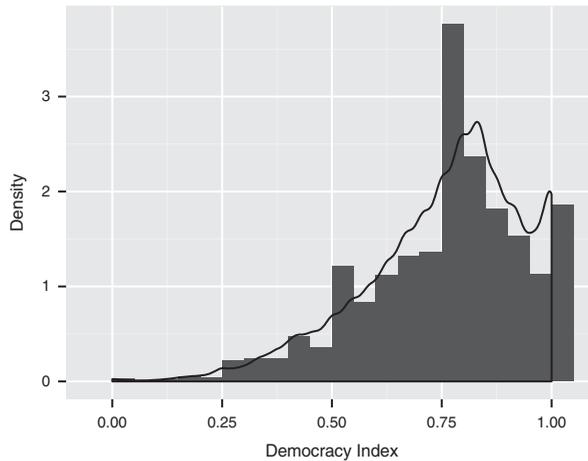

Fig. 2. High level of support for democratic values among respondents

sample of Pakistanis, with scores on the index heavily skewed toward 1 (mean = 0.75, SD = 0.18).

To evaluate Hypothesis 1 (i.e., to test how the two different conceptualizations of *shari`a* are related to democratic values), we use ordinary least squares regression with standard errors clustered at the primary sampling unit (PSU) level. We estimate the following basic model:

$$Y_i = \beta_1 D_i + \beta_2 X_i + \alpha_j + \varepsilon_i, \tag{1}$$

where Y_i is a continuous variable representing support for democratic values, D_i a continuous variable for conceptualizing a *shari`a* government as providing for the people, X_i a continuous variable for conceptualizing a *shari`a* government as imposing Islamic legal and social norms, α_j district fixed effects, and ε_i a normally distributed error term. We then add in a set of demographic covariates, including gender, age, ethnicity, formal education level, household expenditures, household assets, and indicators for head of household, urban location, able to read, and able to perform arithmetic. In a third specification of the model, we add additional religiosity covariates, including indicators for religious sect (Ahl-e-sunnat, *Deobandi*, Ahl-e-hadis, and *Shi`ah*), number of times the respondent prays *namaz* per week, and an indicator for whether or not the person prays *tahajjud namaz*.¹¹ In our final specification, we use tehsil instead of district fixed effects, in addition to the full set of demographic and religiosity controls.¹²

Across all four specifications of our model, we find that conceptualizing a *shari`a* government as one that provides for its citizens is positively associated with support for democratic values, whereas conceptualizing a *shari`a* government as one that imposes *hudud* punishments and restrictions upon women is not statistically significantly related to support for democratic values (regression results in Table 3).¹³ At the individual level, scores on both the “provides”

¹¹ Pakistanis tend to use the word “namaz” for prayer. (Arabic speakers may prefer to use the word “salat.”) *Tahajjud* is a non-obligatory, additional prayer.

¹² In Pakistan, there are three main sub-national administrative units: province, districts, tehsils. There are four main provinces: the Punjab, Balochistan, Sindh, and Khyber Pakhtunkhwa. In the Federally Administered Tribal Agencies, the agency is the basic administrative unit.

¹³ Expanded regression tables for all analyses showing the coefficients and standard errors for covariates can be found in Online Appendix 3.

* $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$ (two-tailed).

and “imposes” indices seem to matter. Individuals who are above the median on “provides” but below the median on “imposes” are more supportive of democratic values than those who are above the median on both “provides” and “imposes” ($p = 0.005$). In other words, individual respondents who believe that a *shari`a* government is one that provides for its citizens are more supportive of democratic values when they do not also hold the view that a *shari`a* government is one that imposes Islamic punitive legal and social norms. Individuals who are high on “provides” but low on “imposes” are more supportive of democratic values than individuals who understand a *shari`a* government to be one that imposes Islamic legal and social norms but not one that provides better governance ($p < 0.001$). They are also more supportive of democratic values than individuals who do not strongly conceptualize a *shari`a* government as either providing or imposing ($p < 0.001$).

Shari`a and Support for Islamist Militancy

To measure support for Islamist militancy, the survey included questions on respondents’ level of support for two Pakistan-based, *Deobandi* militant groups: the anti-*Shi`ah* SSP and the Afghan Taliban.¹⁴ Both of these groups have employed physical punishments, inclusive of killing those they deem to be worthy of death based on their interpretations of religious prescriptions. Enumerators asked respondents to indicate how much they support each militant group and its actions on a five-point scale ranging from “A great deal” to “Not at all.” We average responses to these two questions to get a direct measure of support for these

¹⁴ While the Afghan Taliban focus their efforts upon ousting foreign troops and undermining the current democratic structure in Afghanistan, the Afghan Taliban’s various leadership *shuras* (consultative groups) are based in Pakistan. Additionally, the Afghan Taliban have long enjoyed sanctuary in Pakistan as well as ongoing logistical, financial, military, and diplomatic support from Pakistan. For these reasons we call the Afghan Taliban “Pakistan-based.” It should also be noted that SSP and the Afghan Taliban have long-standing ties to one another (Abou Zahab 2002).

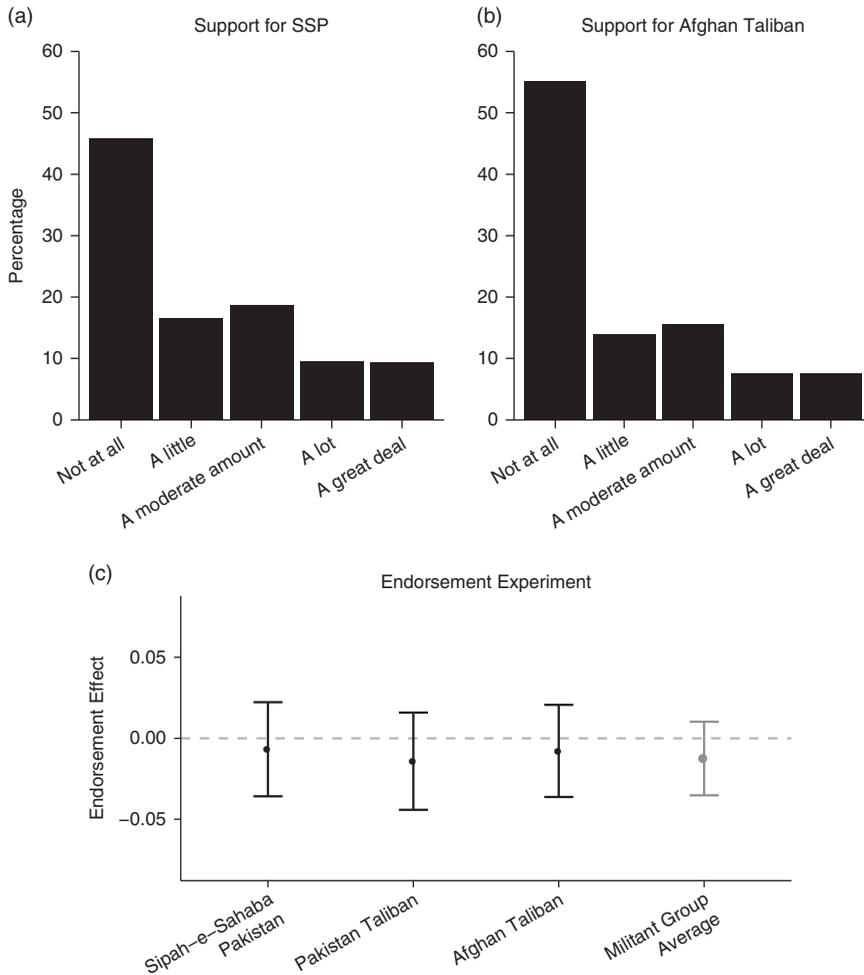

Fig. 3. Low levels of support for militant groups among respondents
 Note: SSP = Sipah-e-Sahaba-e-Pakistan.

important *Deobandi* militant groups (scaled from 0 to 1). We find that support for Islamist militancy is relatively low among respondents in this sample. As shown in Figure 3, mean support for SSP is 0.30 (SD = 0.34) and mean support for the Afghan Taliban is 0.25 (SD = 0.33).

However, asking respondents directly whether they support militant organizations can be problematic in places afflicted by political violence. Item non-response rates to such sensitive and direct questions are often quite high given that respondents may fear that providing the “wrong” answer will threaten their own and their family’s safety. In this data set, non-response rates for the direct questions assessing support for SSP and the Afghan Taliban were 17.1 and 13.3 percent, respectively. Responses may be subject to social desirability bias, as respondents may answer in ways they think will appease presumably higher-status enumerators, rather than divulging their personal attitudes.

Therefore, we also used an indirect measure of support for specific Islamist organizations in the form of an endorsement experiment.¹⁵ Endorsement experiments were first used in a conflict area to study support for political violence by Blair et al. (2013), and have since been used in other similar contexts.¹⁶ In the survey, respondents were randomly assigned to one of four treatment groups or to a control group. Respondents in the control group were asked their level of support for four policies, measured on a five-point scale, recoded to lie between 0 and 1 for the analysis.¹⁷ The research team identified policies for use in the experiment by closely perusing Pakistani domestic press accounts and conducting extensive pre-testing and focus groups. They selected four contemporary policy proposals that were relatively well known but about which Pakistanis were unlikely to have extremely hardened opinions: (1) plans to bring in the army to deal with the violence in Karachi; (2) “mainstreaming” the FATA; (3) using peace jirgas to solve outstanding bilateral disputes between Afghanistan and Pakistan including the conflict over the Durand Line; and (4) engaging in a dialogue with India over bilateral issues. Respondents in the treatment groups were asked identical questions about their support for these policies, but were then told that one of four militant organizations/people supports the policy in question (SSP, Pakistan Taliban, Afghan Taliban, Abdul Sattar Edhi).¹⁸ This approach makes the policy, rather than the militant group, the primary object of evaluation. Since the only difference between the treatment and control conditions is the endorsement by the militant group, the difference in means between treatment and control groups provides a measure of affect toward the groups.

Consistent with the results from the direct questions, support for militancy is relatively low in this sample when measured using an endorsement experiment. Overall, the inclusion of an endorsement from a militant group seems to slightly decrease support for the policies in the endorsement experiment, although not significantly so (see Figure 3).¹⁹ Thus, while Pakistanis in this sample express high levels of support for democratic values, they are not highly supportive of Islamist militant groups.

To test how the two conceptualizations of *shari`a* government are related to support for militancy using the direct measurement (Hypothesis 2), we employ the same ordinary least squares regression strategy used above for democratic values. We estimate the following basic model:

$$Z_i = \beta_1 D_i + \beta_2 X_i + \alpha_j + \varepsilon_i, \quad (2)$$

where Z_i is a continuous variable representing support for democratic values, D_i a continuous variable for conceptualizing a *shari`a* government as providing for the people, X_i a continuous variable for conceptualizing a *shari`a* government as imposing Islamic legal and social norms, α_j district fixed effects, and ε_i a normally distributed error term. Standard errors are clustered at the PSU level. In additional specifications of the model, we include (1) demographic covariates,

¹⁵ The endorsement experiment measured support for SSP and the Afghan Taliban, as well as one additional group, the Pakistan Taliban. Note that all results presented in this paper are robust to the inclusion or exclusion of the Pakistan Taliban in the endorsement experiment.

¹⁶ See Bullock, Imai and Shapiro (2011) for a methodological justification of endorsement experiments.

¹⁷ We recode all variables to lie between 0 and 1 so we can easily interpret a regression coefficient as representing a 100 β percentage point change in the dependent variable associated with moving from the lowest possible value of the independent variable to the largest possible value. For independent variables representing experimental conditions, the regression coefficient tells us the treatment effect size in percentage point terms.

¹⁸ The purpose of including Edhi, a well-known humanitarian, is that he is a broadly popular figure in Pakistan. Thus, if the endorsement experiment is working as expected, then his endorsement should increase respondent support for the policies on average. This is the case, as shown in Fair et al. (2014, 2016).

¹⁹ Regression results for the endorsement experiment are in Online Appendix 3.

(2) demographic and religiosity covariates, and (3) tehsil fixed effects plus the full set of demographic and religiosity covariates.

Additionally, we analyze the results of the endorsement experiment by estimating the following ordinary least squares regression model:

$$P_i = \beta_1 T_i + \beta_2 D_i + \beta_3 (T_i \times D_i) + \beta_4 X_i + \beta_5 (T_i \times X_i) + \alpha_j + \varepsilon_i, \quad (3)$$

where P_i is a continuous variable representing average support for the four target policies, T_i a dummy variable representing assignment to any militant group treatment condition, D_i a continuous variable for conceptualizing a *shari`a* government as providing for the people, X_i a continuous variable for conceptualizing a *shari`a* government as imposing Islamic legal and social norms, α_j district fixed effects, and ε_i a normally distributed error term. Our key parameters of interest are β_3 and β_5 , from which we can derive the marginal effect of conceptualizing *shari`a* as providing for its citizens on support for militancy (β_3), and conceptualizing *shari`a* as imposing Islamic legal and social norms on support for militancy (β_5). Because the endorsement treatment was assigned at the PSU level, standard errors are clustered at that level. In additional specifications of the model, we include (1) demographic covariates, (2) demographic and religiosity covariates, and (3) tehsil fixed effects plus the full set of demographic and religiosity covariates.

We find support for Hypothesis 2; those who conceptualize a *shari`a*-based government as one that imposes Islamic legal and social norms are more likely to support Islamist militancy (Table 4). In contrast, we find no statistically significant relationship between conceptualizing a *shari`a*-based government as one that provides for its citizens and supporting Islamist militancy. This finding is consistent across the direct measurement of support for militancy and the endorsement experiment, and is robust to a number of specifications of the model. At the individual level, those who are above the median on the “imposes” index are more supportive of militancy ($p = 0.000$), regardless of their scores on the “provides” index ($p = 0.985$). Thus, individuals who conceive of a *shari`a*-based government as imposing *hudud* punishment and restricting women’s role in public are more supportive of militancy than those who do not, even if they also believe that a *shari`a*-based government provides for its citizens.

DISCUSSION

Pakistanis hold two different, albeit not necessarily opposing, conceptualizations of an Islamic government guided by *shari`a*. One conceptualization supposes a government that is transparent, fair, and provides services. The other articulates a government that imposes *hudud* punishments and restricts participation of women in civic life. These two conceptualizations relate differently to support for democratic values and support for militant groups in Pakistan. Disambiguating these differing conceptions allows us to reconcile some of the existing and discordant studies on these topics. On the one hand, conceptualizing an Islamic government as one that implements *shari`a* by providing services and security for the people is associated with increased support for democratic values. On the other hand, conceptualizing an Islamic government as one that implements *shari`a* by imposing *hudud* punishments and restricting women’s public roles is associated with increased support for militancy.

While these results—that liberal interpretations of *shari`a* are correlated with general support for political liberalism and dislike of jihadi groups—may seem somewhat intuitive once articulated, this important distinction has not been made in existing literature largely because there has been no similarly exhaustive effort to identify respondent beliefs about *shari`a* in a

nationally representative sample in a predominantly Muslim country. This work underscores the potential perils of simply using survey items about general support for *shari`a* as an independent variable to explore support for violent politics or democracy and underscores the need for detailed batteries about respondent beliefs about *shari`a* in the countries of study.

These findings have important implications for the study of political Islam, and suggest that measuring popular support for *shari`a*, a theoretically and practically complex topic, cannot rely on operationalizations of it as a unidimensional concept. Doing so limits scholarly understanding of *shari`a*'s predictive power for a variety of attitudes and values. These partial operationalizations may explain inconclusive results in existing literature, as the lack of an accurate definition of *shari`a* precludes scholars from knowing what their measurement of support means for the respondents. Recognizing and accurately capturing the multi-dimensional nature of the concept also may explain how of *shari`a* is utilized by real-world actors for motivating and mobilizing various and seemingly contradictory forms of political behavior, ranging from violent and extraparticipatory to peaceful and electoral.

Our findings also have import for survey research methodologies. Using overly broad or imprecise definitions of complex political concepts in survey instruments can ignore important

complexities in political views. In our specific case, a political term that is commonly used and is highly relevant in contemporary politics is revealed, upon further analysis, to have at least two different meanings within the specific case of Pakistan. Measuring its support without understanding how individuals who engage with it politically would leave us in an analytical bind; a measurement of support would tell us little without subsequent questions about what the term actually means in a practical sense. But the issue of multi-dimensionality is not specific to *shari`a*. Scholars constantly work with core concepts—including but not limited to democracy, authoritarianism, revolution, vote buying, and gender—that not only have multiple components to their academic definition, but which are heterogeneous in the way individuals live and experience, and thus define, these concepts.

CONCLUSION AND IMPLICATIONS

Our analyses and results demonstrate that support for *shari`a*, a theoretically and practically complex topic, should not be operationalized as a unidimensional concept. As with any type of government, Islamic governments can be conceptualized to perform a multitude of services. Individuals within the same political and national contexts can have different interpretations of what a *shari`a* government actually means, and these varying definitions will change the way that support for *shari`a* relates to other attitudes that policymakers and scholars find important. Nationally representative evidence from Pakistanis demonstrates important variation in their notions of *shari`a*. Given that Muslim polities beyond Pakistan have some notion of *shari`a* that is based upon aspects of good governance and service provision, researchers must be extremely careful in how they operationalize this complicated phenomenon. In future work, researchers need to understand what *shari`a* means in the population that they are studying, and carefully design surveys and other research tools to accurately capture these definitions. We believe that while this work is a step in the right direction, the data employed here may also only partially exhibit that facets that Pakistanis ascribe to a government informed by *shari`a*. Additionally, both support for democracy and militant violence are likely multi-dimensional concepts that would benefit from greater exploration in a given context. Our results strongly suggest that this is an area that requires further research both in Pakistan and other countries.

With the caveat that this effort is a first step toward refining our understanding of these complex relationships, our findings do have implications for policymakers who rely upon extant, albeit less-than-optimal, measurements of *shari`a* to predict adverse developments in a given country. With respect to Pakistan, policymakers have long feared that Pakistanis' support for *shari`a* indicates a preference for a kind of governance evidenced during the Taliban's governance of Afghanistan. Worse, they have taken this to be a proxy for greater support for Islamist violence generally and violence aimed at American interests in particular. These fears, in part, motivate American preferences for greater secularism in countries like Pakistan. Our findings suggest that such reasoning is not only empirically unjustified, but may also be counterproductive.

Depending upon how individuals within a particular context and time period conceptualize a *shari`a*-based government, public support for *shari`a* can either be a positive force for democracy or a predictor of support for militant politics. Many of the existing assumptions about Islam posit a negative relationship with democracy, and suggest that secularized politics divorcing religion from the region's political realm would be preferable. These assumptions also appear to undergird policy initiatives in the region. In reality, employing Islamic rhetoric and emphasizing the democratic aspects of Islamic law may be helpful in drumming up support for democratic values, as well as for related policies and programs.

ACKNOWLEDGMENTS
