We will define local times of self-intersection for multidimensional Brownian motion as generalized Wiener functionals under the framework of white noise analysis as in H. Watanabe ([6]). By making use of the chaotic representation of \( \delta \)-function and precise computation we get a deep insight into the problem. In the section 1 multiple Wiener integrals with respect to multidimensional Brownian motion and chaotic representations for square-integrable Wiener functionals are given. They are indispensable, but seem not to be formulated clearly and correctly before. The useful concepts and results of white noise analysis are illustrated in the section 2. Section 3 is the main part of the paper. The applications to local times are introduced in the section 4 briefly.

1. Multiple Wiener integrals

Let \( B = \{ (B_1^t, \cdots, B_d^t), -\infty < t < \infty \} \) be a \( d \)-dimensional Brownian motion defined on a probability space \( (\Omega, \mathcal{F}, P) \) such that \( \mathcal{F} = \sigma((B_1^t, \cdots, B_d^t), -\infty < t < \infty) \). We will define the multiple Wiener integrals with respect to \( B \).

The procedure will be sketched, and all proofs omitted, since they are completely similar to that for one-dimensional Brownian motion (cf. [3]).

Let \( n = n_1 + \cdots + n_d, n_j \geq 0, j = 1, \ldots, d \). For each \( f \in L^2(\mathbb{R}^n) \) define

\[
\hat{f}(t_1, \cdots, t_n) = \frac{1}{n_1! \cdots n_d!} \sum \sum f(t_{\pi_1}^1, \cdots, t_{\pi_{n_1}}^1, \cdots, t_{\pi_1}^d, \cdots, t_{\pi_{n_d}}^d),
\]

where \( \pi_j, j = 1, \ldots, d \), are the permutations of \( (n_1 + \cdots + n_{j-1} + 1, \ldots, n_1 + \cdots + n_j), j = 1, \ldots, d \), respectively, and the summations are over all permutations \( \{\pi^1, \cdots, \pi^d\} \). Write
\[
L^2(\mathbb{R}^n) \otimes \cdots \otimes L^2(\mathbb{R}^n) = \{ \tilde{f} : f \in L^2(\mathbb{R}^n) \}.
\]

For each \( f \in L^2(\mathbb{R}^n) \) we can define

\[
I_{n_1,\ldots,n_d}(f) = \int f(t_1,\ldots,t_n) dB_{t_1}^{n_1} \cdots dB_{t_{n_1}}^{n_{n_1}} \cdots dB_{t_{n_1}+\cdots+n_{n_d}-1}^{n_d} \cdots dB_{t_n}^{n_n},
\]
such that for any \( f \in L^2(\mathbb{R}^n) \)

1. \( I_{n_1,\ldots,n_d}(f) = I_{n_1,\ldots,n_d}(\tilde{f}) \),
2. \( E[I_{n_1,\ldots,n_d}(f)] = 0 \),
3. for any \( g \in L^2(\mathbb{R}^m) \), \( m = m_1 + \cdots + m_d \), \( m_j \geq 0, j = 1,\ldots,d \),
4. \( E[I_{n_1,\ldots,n_d}(f)I_{m_1,\ldots,m_d}(g)] = n_1! \cdots n_d! \langle \tilde{f}, \tilde{g} \rangle \delta_{(n_1,\ldots,n_d)(m_1,\ldots,m_d)} \),
5. for any \( g \in L^2(\mathbb{R}^m) \), \( a, b \in \mathbb{R} \)

\[
I_{n_1,\ldots,n_d}(af + bg) = a I_{n_1,\ldots,n_d}(f) + b I_{n_1,\ldots,n_d}(g),
\]
6. for \( f(t_1,\ldots,t_n) = f_1(t_1,\ldots,t_{n_1}) \cdots f_d(t_{n_1+\cdots+n_{n_d-1}},\ldots,t_n) \), \( f_j \in L^2(\mathbb{R}^n) \),

\[
I_{n_1,\ldots,n_d}(f) = \int f_1 dB_{t_1}^{n_1} \cdots dB_{t_{n_1}}^{n_{n_1}} \cdots \int f_d dB_{t_{n_1}+\cdots+n_{n_d-1}}^{n_d} \cdots dB_{t_n}^{n_n}.
\]

Thus \( I_{n_1,\ldots,n_d}(\tilde{f}) \) is an isometric mapping from \( \mathbb{L}^2(\mathbb{R}^n) \otimes \cdots \otimes \mathbb{L}^2(\mathbb{R}^n) \) into \( (L^2)^d = L^2(\Omega, \mathcal{F}, \mathbb{P}) \). The most important result is the following chaotic representation for square-integrable Wiener functionals:

To any \( \phi \in (L^2)^d \) corresponds a unique sequence \( \{\phi_{n_1,\ldots,n_d} \in \mathbb{L}^2(\mathbb{R}^n) \otimes \cdots \otimes \mathbb{L}^2(\mathbb{R}^n) \}, n_j \geq 0, j = 1,\ldots,d \) such that

\[
\phi = \sum_{n=0}^{\infty} \sum_{n_1+\cdots+n_d=n} I_{n_1,\ldots,n_d}(\phi_{n_1,\ldots,n_d}),
\]
and

\[
\| \phi \|_2^2 = \sum_{n=0}^{\infty} \sum_{n_1+\cdots+n_d=n} n_1! \cdots n_d! \| \phi_{n_1,\ldots,n_d} \|_2^2,
\]
where \( I_0(f) = E[f] \). Later we will denote (1.8) simply by \( \phi \sim (\phi_{n_1,\ldots,n_d}) \).

2. White noise space

We adopt the framework of white noise analysis set by T. Hida (cf. [1] or [2]).
SELF-INTERSECTION FOR BROWNIAN MOTION

Let \( \mathcal{S}(\mathbb{R}) \) be the Schwartz space of rapidly decreasing functions on \( \mathbb{R} \). Denote by \( A \) the self-adjoint extension of the harmonic oscillator operator on \( L^2(\mathbb{R}) \):

\[
Af(t) = -f''(t) + (1 + t^2)f(t), \quad f \in \mathcal{S}(\mathbb{R}).
\]

Let \( H_n(x), \ n \geq 0, \) be the Hermite polynomial of order \( n \), and

\[
e_n(x) = (n!2^n)^{-\frac{1}{2}}(\pi)^{-\frac{1}{4}}H_n(x)e^{-x^2/2}, \ n \geq 0.
\]

Then \( e_n \in \mathcal{S}(\mathbb{R}) \), and \( \{e_n, n \geq 0\} \) is an orthogonal normal basis of \( L^2(\mathbb{R}) \) and

\[
Ae_n = (2n + 2)e_n, \quad n \geq 0.
\]

Put

\[
|f|_{2,p}^2 = |A^p f|_2^2 = \sum_{n=0}^{\infty} (2n + 2)^{2p} |\langle f, e_n \rangle|^2, \ f \in L^2(\mathbb{R}),
\]

\[
\mathcal{S}_p(\mathbb{R}) = \mathcal{S}(A^p) = \{f \in L^2(\mathbb{R}) : |f|_{2,p}^2 < \infty\}, \ p \geq 0.
\]

With \( \{|.|_{2,p}, p \geq 0\} \) \( \mathcal{S}(\mathbb{R}) \) is a nuclear space. Let \( \mathcal{S}'(\mathbb{R}) \) be its dual. Set

\[
\mathcal{S}_p(\mathbb{R}) = \left\{ f \in \mathcal{S}'(\mathbb{R}) : |f|_{2,p}^2 = \sum_{n=0}^{\infty} (2n + 2)^{2p} |\langle f, e_n \rangle|^2 < \infty \right\}, \ p \in \mathbb{R},
\]

where \( \langle \cdot, \cdot \rangle \) denotes the pairing between \( \mathcal{S}(\mathbb{R}) \) and \( \mathcal{S}'(\mathbb{R}) \). Then

\[
\mathcal{S}(\mathbb{R}) = \bigcap_{p \in \mathbb{R}} \mathcal{S}_p(\mathbb{R}), \quad \mathcal{S}'(\mathbb{R}) = \bigcup_{p \in \mathbb{R}} \mathcal{S}_p(\mathbb{R}).
\]

By Minlos theorem there exists a unique probability measure \( \mu \) on \( \mathcal{B}(\mathcal{S}'(\mathbb{R})) \), the \( \sigma \)-field generated by cylinder sets, such that

\[
\int_{\mathcal{S}'(\mathbb{R})} e^{i\langle x, \xi \rangle} \mu(dx) = \exp\left\{-\frac{1}{2} |\xi|_{2}^2\right\}, \quad \xi \in \mathcal{S}(\mathbb{R}).
\]

The measure \( \mu \) is called the white noise measure, and the probability space \( (\mathcal{S}'(\mathbb{R}), \mathcal{B}(\mathcal{S}'(\mathbb{R})), \mu) \) is called the white noise space. Define

\[
(\Omega_{\mathcal{S}}, \mathcal{F}, \mu_\mathcal{S}) = (\mathcal{S}'(\mathbb{R}), \mathcal{B}(\mathcal{S}'(\mathbb{R})), \mu)^d.
\]

It will be our fundamental probability space, and denote by \( (L^{2,d}) \) the \( L^2 \)-space on it. Set

\[
X^j_t(x) = \langle x_j, \xi \rangle, \quad x = (x_1, \ldots, x_d) \in \Omega_{\mathcal{S}}, \ \xi \in \mathcal{S}(\mathbb{R}), \ j = 1, \ldots, d.
\]

For each \( j, \xi \mapsto X^j_t \) is an isometric mapping from \( \mathcal{S}(\mathbb{R}) \) into \( L^{2,d} \), and can be extended as an isometric mapping from \( L^2(\mathbb{R}) \) into \( L^{2,d} \), i.e., \( X^j_t \) is well defined for
\[ \xi \in L^2(\mathbb{R}). \] Put
\[ f_i = \begin{cases} 1_{(0,t]}, & t \geq 0, \\ 1_{(t,0]}, & t < 0, \end{cases} \]
and
\[ (2.11) \quad B^j_t(x) = \langle x, f_i \rangle, \quad -\infty < t < \infty, \quad j = 1, \ldots, d. \]
Then \( B = \{ (B^1_t, \ldots, B^d_t), -\infty < t < \infty \} \) is a \( d \)-dimensional Brownian motion, and \( \mathcal{F}_t = \sigma((B^1_t, \ldots, B^d_t), -\infty < t < \infty) \). Let \( \phi \sim (\phi_{n_1}, \ldots, n_d) \in (L^{2,d}). \) For \( p \geq 0 \), define
\[ (2.12) \quad (\mathcal{A}^d)_p = \left\{ \phi \sim (\phi_{n_1}, \ldots, n_d) \in (L^{2,d}) : \| \phi \|_{2,p}^2 = \sum_{n=0}^{\infty} \sum_{n_1 + \cdots + n_d = n} n_1! \cdots n_d! \| (A^2)^{\otimes n} \phi_{n_1, \ldots, n_d} \|_2 < \infty \right\}. \]
Denote by \( (\mathcal{A}^d)_{-p} \) the dual of \( (\mathcal{A}^d)_p \). Define
\[ (\mathcal{A}^d)^* = \bigcap_{p \geq 0} (\mathcal{A}^d)_p, \]
With \( \| \cdot \|_{2,p}, \ p \geq 0 \) \( (\mathcal{A}^d)^* \) is a nuclear space, and its dual
\[ (\mathcal{A}^d)^* = \bigcup_{p \geq 0} (\mathcal{A}^d)_{-p}. \]
Each element of \( (\mathcal{A}^d) \) is called a test functional, and each element of \( (\mathcal{A}^d)^* \) is called a generalized Wiener functional or Hida distribution.

For \( \xi = (\xi_1, \ldots, \xi_d) \in \mathcal{A}^d(\mathbb{R}) \), exponential functional
\[ (2.13) \quad \delta(\xi)(x) = \exp \left[ \sum_{j=1}^{d} \left( \langle x, \xi_j \rangle - \frac{1}{2} \langle \xi_j, \xi_j \rangle \right) \right] \sim \left( \frac{1}{n_1! \cdots n_d!} \xi_1^{\otimes n_1} \otimes \cdots \otimes \xi_d^{\otimes n_d} \right), \]
\[ x = (x_1, \ldots, x_d) \in \Omega_d, \]
is a test functional. For any \( \Phi \in (\mathcal{A}^d)^* \) the \( S \)-transform of \( \Phi \) is defined as
\[ (2.14) \quad (S\Phi)(\xi) = \langle \langle \Phi, \delta(\xi) \rangle \rangle, \quad \xi \in \mathcal{A}^d(\mathbb{R}), \]
where \( \langle \cdot, \cdot \rangle \) denotes the pairing between \( (\mathcal{A}^d) \) and \( (\mathcal{A}^d)^* \). If \( \Phi \in (L^{2,d}) \), then
\[ (2.15) \quad (S\Phi)(\xi) = \int_{\Omega_d} \Phi(x + \xi) \mu_d(dx). \]
A functional \( U \) on \( \mathcal{A}^d(\mathbb{R}) \) is called a \( U \)-functional. If
1) for each \( \xi = (\xi_1, \ldots, \xi_d) \in \mathcal{A}^d(\mathbb{R}) \) the mapping
has analytic continuation, denoted by \( u(z_1, \cdots, z_d; \xi_1, \cdots, \xi_d) \), on \( C^n \);

2) for any \( n = n_1 + \cdots + n_d, \ n_j \geq 0, \ j = 1, \ldots, d, \)

\[
U_{n_1, \ldots, n_d}(\xi_1, \ldots, \xi_d) = \frac{1}{n_1! \cdots n_d!} \sum_{j_1=1}^{n_1} \cdots \sum_{j_d=1}^{n_d} (-1)^{n-\sum j_i} \partial^{n_j} z_{j_1} \cdots \partial^{n_d} z_{j_d}
\]

is multilinear in \( (\xi_1, \cdots, \xi_d) \);

3) there exist constants \( C_1 > 0, \ C_2 > 0, \ p \in R \) such that for all \( (z_1, \cdots, z_d) \in C^n \) and \( (\xi_1, \cdots, \xi_d) \in \mathcal{D}(R) \)

\[
| u(z_1, \cdots, z_d; \xi_1, \cdots, \xi_d) | \leq C_1 \exp \left\{ C_2 \sum_{j=1}^{d} |z_j|^2 | \xi_j|_{2,p}^2 \right\}.
\]

Potthoff–Streit characterization theorem states that a functional on \( \mathcal{D}(R) \) is the \( S \)-transform of a Hida distribution if and only if it is a \( U \)-functional (cf. [5], only the case of \( d = 1 \) is discussed there). Every Hida distribution is uniquely determined by its \( S \)-transform. In particular, if

\[
(2.16) \quad U(\xi) = \sum_{n=0}^{\infty} \sum_{n_1 + \cdots + n_d = n} \langle f_{n_1, \ldots, n_d}, \xi_1^{\otimes n_1} \otimes \cdots \otimes \xi_d^{\otimes n_d} \rangle
\]

and for some \( p \geq 0 \)

\[
(2.17) \quad \sum_{n=0}^{\infty} \sum_{n_1 + \cdots + n_d = n} n_1! \cdots n_d! \ | (A^{-p})^{\otimes n} f_{n_1, \ldots, n_d} |_{2-p}^2 < \infty,
\]

where \( f_{n_1, \ldots, n_d} \in L^2(R^n) \otimes \cdots \otimes L^2(R^n) \), then there exists \( \Phi \in \mathcal{D}^{d,p}(R^n) \) such that \( (S\Phi)(\xi) = U(\xi) \), and the expression in (2.17) is just equal to \( \| \Phi \|_{2-p}^2 \). In this case, we also denote \( \Phi \sim (f_{n_1, \ldots, n_d}) \).

3. Local times of self-intersection

Let \( f \) be a bounded Borel function on \( R^d \). Then it is well-known by (2.15) that for any \( 0 \leq s \leq t \)

\[
[Sf(B_t - B_s)](\xi) = [T_{t-s}^{(d)} f] \left( \int_s^t \xi(r) \, dr \right),
\]

where \( \{ T_t^{(d)}, t \geq 0 \} \) is the transition semigroup of \( d \)-dimensional Brownian mo-
tion:

\[
(3.1) \quad [T^{(d)}_{t-s} f](x) = \int f(y_1, \cdots, y_d) \frac{1}{[2\pi(t-s)]^{d/2}} \exp \left\{ -\frac{1}{2(t-s)} \sum_{j=1}^d (y_j - x_j)^2 \right\} dy_1 \cdots dy_d
\]

Let \( \delta_{a}, a = (a_1, \cdots, a_d) \), be the \( \delta \)-function at point \( a \). From (3.1) we have formally

\[
(3.2) \quad [S_{\delta_{a}}(B_B - B_a)](\xi) = \frac{1}{[2\pi(t-s)]^{d/2}} \exp \left\{ -\frac{1}{2(t-s)} \sum_{j=1}^d \left( a_j - \int_s^t \xi_j(r) dr \right)^2 \right\}.
\]

It is not difficult to see that the right hand of (3.2) is a \( \mathcal{U} \)-functional. In fact, by the formula of the generating function for Hermite polynomials we have

\[
\exp \left\{ -\frac{1}{2(t-s)} \left( \int_s^t \xi_j(r) dr - a_j \right)^2 \right\} = e^{-x_j^2/2} \sum_{n=0}^\infty \frac{1}{n!} H_n(x_j) \left( \frac{\int_s^t \xi_j(r) dr}{\sqrt{2(t-s)}} \right)^n
\]

\[
[2\pi(t-s)]^{-d/2} \exp \left\{ -\frac{1}{2(t-s)} \sum_{j=1}^d \left( \int_s^t \xi_j(r) dr - a_j \right)^2 \right\}
\]

\[
= [2\pi(t-s)]^{-d/2} e^{-x_j^2/2} \sum_{n=0}^{\infty} \prod_{j=1}^d \frac{1}{n_j!} H_n(x_j) \left( \frac{\int_s^t \xi_j(r) dr}{\sqrt{2(t-s)}} \right)^n,
\]

where \( x_j = \frac{a_j}{\sqrt{2(t-s)}} \). Put

\[
\phi^{(a)}_{n_1, \ldots, n_d}(s, t) = [2\pi(t-s)]^{-d/2} e^{-x_j^2/2} \prod_{j=1}^d \frac{1}{n_j!} H_n(x_j) \left( \frac{\int_s^t \xi_j(r) dr}{\sqrt{2(t-s)}} \right)^{n_j}
\]

(3.3)

\[
[A^{-p}]^{\otimes n} \phi^{(a)}_{n_1, \ldots, n_d}(s, t) \leq 2^{-2n} \left| \phi^{(a)}_{n_1, \ldots, n_d}(s, t) \right|^2
\]

\[
\leq 2^{-2n} [2(t-s)]^{-d/2} \prod_{j=1}^d \frac{1}{n_j!} e_n^n(x_j) \left( \frac{1}{\sqrt{t-s}} \right)^{2n}
\]

\[
\leq C 2^{-2n} [2(t-s)]^{-d/2} \prod_{j=1}^d \frac{1}{n_j!},
\]

Note that \( (e_n(x), n \geq 0) \) is uniformly bounded: \( C = \sup_{n,x} |e_n(x)| < \infty \). Now for any \( p > 0 \) we have
where \( n = n_1 + \cdots + n_d \), and
\[
\sum_{n=0}^{\infty} \sum_{n_1 + \cdots + n_d = n} n_1! \cdots n_d! | (A^{-p})^{\otimes \phi_{n_1,\ldots,n_d}(s,t)} |^2
\leq C^2 [2(t-s)]^{-d} \pi^{-d/2} \sum_{n=0}^{\infty} \sum_{n_1 + \cdots + n_d = n} 2^{-2np}
\leq C^2 [2(t-s)]^{-d} \pi^{-d/2} \sum_{n=0}^{\infty} 2^{-2np} C_{n+d-1} < \infty.
\]

According to (2.16) and (2.17), we obtain the following.

**Lemma 1.** For any \( 0 \leq s < t \), \( p > 0 \) and \( a \in \mathbb{R}^d \)
\[
\delta_a(B_t - B_s) \sim (\phi_{n_1,\ldots,n_d}(s,t)) \in (\omega_p^d)_{-p}
\]
is a Hida distribution.

**Theorem 1.** If \( a \neq 0 \), then for any \( t \geq 0 \), \( p > 0 \)
\[
G_a^d(t) = \int_{0 \leq u < v \leq t} \delta_a(B_v - B_u) du dv \in (\omega_p^d)_{-p}
\]
is a Hida distribution.

**Proof.** Noting that
\[
C_a = \pi^{-d/4} \sup_{u > 0} \{(2u)^{-d/2} e^{-|a|^2/4u}\} < \infty,
\]
(3.4) can be modified as
\[
| (A^{-p})^{\otimes \phi_{n_1,\ldots,n_d}(s,t)} |^2 \leq C^2 C_a^2 2^{-2np} \prod_{j=1}^{d} \frac{1}{n_j}.
\]
Then we have
\[
\| \delta_a(B_t - B_s) \|_{L_{-p}}^2 \leq C^2 C_a^2 \sum_{n=0}^{\infty} 2^{-2np} C_{n+d-1},
\]
\[
\int_{0 \leq u < v \leq t} \| \delta_a(B_v - B_u) \|_{L_{-p}}^2 du dv < \infty.
\]
Hence \( G_a^{(\cdot)}(t) \in (\omega_p^d)_{-p} \).

**Theorem 2.** For any \( t \geq 0 \)
(3.5) \[ G_d(t) = \int_{0 \leq u < v \leq t} [\delta(B_v - B_u) - \sum_{n=0}^{d-2} \sum_{n_1 + \cdots + n_d = n} I_n, \ldots, I_d(\phi_n, \ldots, \phi_d(u, v))] dudv \]

is a Hida distribution, called local times of self-intersection for \( d \)-dimensional Brownian motion, where \( \delta = \delta_0 \).

**Proof.** At first, observe that let \( p > 0 \)

(3.6) \[ |A^{-p} 1_{(s,t)}|^2 = \sum_{k=0}^{\infty} (2k + 2)^{-2p} |\langle 1_{(s,t)}, e_k \rangle|^2 \leq \sum_{k=0}^{\infty} (2k + 2)^{-2p} (t-s)^2 \sup_x e_k^2(x) \]

Since \( \sup_x e_k^2(x) = O(k^{-\frac{3}{2}}) \), take \( p \) large enough such that

(3.7) \[ \sum_{k=0}^{\infty} (2k + 2)^{-2p} \sup_x e_k^2(x) < 1. \]

Then by (3.6) and (3.7) we get

(3.8) \[ |(A^{-p}) \otimes^\eta \phi_n, \ldots, \phi_d(s, t)|^2 = [2\pi(t-s)]^{-d} \prod_{j=1}^{d} \left( \frac{H_{n_j}(0)}{n_j!} \right)^2 \left| A^{-p} \frac{1_{(s,t)}}{\sqrt{2(t-s)}} \right|^{2n} \leq \frac{1}{n_1! \cdots n_d!} (2\pi)^{-d} (t-s)^{n-d}, \]

noting that \( H_{2k+1}(0) = 0, H_{2k}(0) = (-1)^k \frac{(2k)!}{k!} \), for any \( k \geq 0 \), \( H_k^2(0) \leq k! 2^k \). Let \( \alpha > 0 \), from (3.8) we have

(3.9) \[ \left\| \delta(B_s - B_t) - \sum_{n=0}^{d-2} \sum_{n_1 + \cdots + n_d = n} I_n, \ldots, I_d(\phi_n, \ldots, \phi_d(s, t)) \right\|^{2,-(p+\alpha)} \]

\[ = \left\| \sum_{n=d-1}^{\infty} \sum_{n_1 + \cdots + n_d = n} I_n, \ldots, I_d(\phi_n, \ldots, \phi_d(s, t)) \right\|^{2,-(p+\alpha)} \]
\[ = \sum_{n=d-1}^{\infty} \sum_{n_1 + \cdots + n_d = n} n_1! \cdots n_d! |(A^{-p+\alpha}) \otimes^\eta \phi_n, \ldots, \phi_d(s, t)|^2 \]
\[ \leq \sum_{n=d-1}^{\infty} \sum_{n_1 + \cdots + n_d = n} 2^{-2n\alpha} (2\pi)^{-d} (t-s)^{n-d} \]
\[ \leq \sum_{n=d-1}^{\infty} \sum_{n_1 + \cdots + n_d = n} 2^{-2n\alpha} C_{n+d-1} (t-s)^{n-d}. \]
Take $\alpha$ large enough such that $2^{-\alpha} \sqrt{t} < 1$. Then

$$\int_{0 \leq u < v \leq t} \left\| \delta(B_u - B_v) - \sum_{n=0}^{d-2} \sum_{n_1 + \cdots + n_d = n} I_{n_1, \ldots, n_d} \phi_{n_1, \ldots, n_d}(u, v) \right\|_{2,-(p+\alpha)}^2 \, du \, dv < \infty.$$ 

Hence, the integral in the right hand of (3.5) exists in $(B^d)_{-(p+\alpha)}$ as Bochner integral, i.e., $G_d(t) \in (B^d)_{-(p+\alpha)}$ is a Hida distribution.

From (3.5) we have

$$G_1(t) = \int_{0 \leq u < v \leq t} \delta(B_u - B_v) \, du \, dv,$$

(3.11) $G_2(t) = \int_{0 \leq u < v \leq t} \{\delta(B_u - B_v) - [2\pi(v - u)]^{-1}\} \, du \, dv$,

(3.12) $G_3(t) = \int_{0 \leq u < v \leq t} \{\delta(B_u - B_v) - [2\pi(v - u)]^{-3/2}\} \, du \, dv$,

(3.13) $G_4(t) = \int_{0 \leq u < v \leq t} \left\{\delta(B_u - B_v) - \frac{1}{[2\pi(v - u)]^2} \right.$

$\left. + \frac{1}{(2\pi)^2(v - u)^{3}} \sum_{j=1}^{5} \int_{u}^{v} (B'_u - B'_v) \, dB'_v \right\} \, du \, dv$,

(3.14) $G_5(t) = \int_{0 \leq u < v \leq t} \left\{\delta(B_u - B_v) - \frac{1}{[2\pi(v - u)]^{5/2}} \right.$

$\left. + \frac{1}{(2\pi)^{5/2}(v - u)^{7/2}} \sum_{j=1}^{5} \int_{u}^{v} (B'_u - B'_v) \, dB'_v \right\} \, du \, dv$,

For $d \geq 2$, the integral

$$\int_{0 \leq u < v \leq t} \delta(B_u - B_v) \, du \, dv$$

has no meaning even in generalized sense, and must be renormalized according to (3.5). The renormalization parts in $G_4(t)$ and $G_5(t)$ in Watanabe ([6]) are mistaken, caused by his small error in computation.

**Lemma 2.** Set

$$a^{(d)}_{\alpha}(t) = \left| \int_{0 \leq u < v \leq t} (v - u)^{-\frac{\alpha + d}{2}} 1_{(u,v)} \, du \, dv \right|^2.$$
Then as \( n \to \infty \), for \( t > 0 \) we have

\[
(3.15) \quad a_n^{(d)}(t) = \begin{cases} \frac{2t^3}{3n^2}, & d = 1, \\ \frac{2t^2}{n^2}, & d = 2, \\ \infty, & d \geq 3. \end{cases}
\]

**Proof.** By Fubini theorem on interchanging the order of integration, we have

\[
(3.16) \quad a_n^{(d)}(t) = \int_{0 \leq u < v < t} \int_{0 \leq r < s < t} \frac{|\langle 1_{[u,v]}, 1_{[r,s]} \rangle|^{2n}}{(v-u)^{n+d/2}(s-r)^{n+d/2}} \, du \, dv \, dr \, ds
\]

\[
= \int_{0 \leq u < v < t} \int_{0 \leq r < s < t} \frac{(v \land s - u \lor r)^{2n}}{(v-u)^{n+d/2}(s-r)^{n+d/2}} \, du \, dv \, dr \, ds
\]

\[
= 2 \int_{0 \leq r < u < v < t} \frac{(s-u)^{2n}}{(v-u)^{n+d/2}(s-r)^{n+d/2}} \, du \, dv \, dr \, ds
\]

\[
+ 2 \int_{0 \leq r < u < v < t} \frac{(v-u)^{n+d/2}}{(s-r)^{n+d/2}} \, du \, dv \, dr \, ds
\]

\[
= 2(a_n^{(d)}(t) + a_{n2}^{(d)}(t)).
\]

\[
(3.17) \quad a_{n2}^{(d)}(t) = \int_{0 \leq r \leq s \leq t} (s-r)^{-(n+d/2)} \, dr \int_{r < u < s} (v-u)^{n-d/2} \, du \, dv
\]

\[
= [(n-d/2 + 1)(n-d/2 + 2)]^{-1} \int_{0 \leq r \leq s \leq t} (s-r)^{2-d} \, dr \, ds
\]

\[
= C_t^{(d)} \left[ (n-d/2 + 1)(n-d/2 + 2) \right],
\]

where

\[
(3.18) \quad C_t^{(d)} = \int_{0 \leq r \leq s \leq t} (s-r)^{-(d+2)} \, dr \, ds = \begin{cases} t^3/6, & d = 1, \\ t^2/2, & d = 2, \\ \infty, & d \geq 3. \end{cases}
\]

Below we consider only the case of \( d = 1 \) or \( 2 \).

\[
(3.19) \quad a_n^{(d)}(t) = 2 \int_{0 \leq u < v < t} \frac{(s-u)^{2n}}{(v-u)^{n+d/2}} \, du \, dv \, ds \int_{0}^{u} \frac{dr}{(s-r)^{n+d/2}}
\]
\[ = (n + d/2 - 1)^{-1} \int_{0 \leq u < v \leq t} \left[ \frac{(s - u)^{n-d/2+1}}{(v - u)^{n+d/2}} - \frac{(s - u)^{2n}}{(v - u)^{n+d/2-1}} \right] \, du \, dv \, ds \]

\[ = (n + d/2 - 1)^{-1} \left[ a_{n11}(t) - a_{n12}(t) \right]. \quad (0 \leq a_{n12}(t) \leq a_{n11}(t).) \]

(3.20) \[ a_{n11}(t) = \int_{0 \leq u < v \leq t} (v-u)^{-(n+d/2)} \, dv \int_{t}^{v} (s-u)^{n-d/2+1} \, ds \]

\[ = C_{t}^{(d)} (n - d/2 + 2)^{-1}. \]

\[ a_{n12}(t) = \int_{0 \leq u < s \leq t} \frac{(s-u)^{2n}}{s^{n+d/2-1}} \, dv \int_{s}^{t} \frac{dv}{(v-u)^{n+d/2}} \]

\[ = (n + d/2 - 1)^{-1} \int_{0 \leq u < s \leq t} \left[ \frac{(s - u)^{n-d/2+1}}{s^{n+d/2-1}} - \frac{(s - u)^{2n}}{(s - u)^{n+d/2-1}} \right] \, dv \, ds 

\[ = (n + d/2 - 1)^{-1} \left[ a_{n121}(t) - a_{n122}(t) \right]. \quad (0 \leq a_{n122}(t) \leq a_{n121}(t).) \]

(3.20) \[ a_{n121}(t) = \int_{0}^{t} s^{-(n+d/2-1)} \, ds \int_{0}^{s} (s-u)^{n+d/2+1} \, du 

\[ = (n + d/2 + 1)^{-1} \int_{0}^{t} s^{-d+3} \, ds = o(1). \]

Thus \( a_{n122}(t) = o(1), \) \( a_{n12}(t) = o(1), \) and by (3.19), (3.20) we have

(3.21) \[ a_{n1}^{(d)}(t) = \frac{1}{n^{2}} C_{t}^{(d)} (1 + o(1)), \quad d = 1, 2. \]

At last, (3.15) follows from (3.16), (3.17), (3.18) and (3.21). \( \square \)

In Lemma 2 one needs only that \( 2n \) is an integer.

**Theorem 3.** For any \( t \geq 0 \) and \( a \in \mathbb{R} \)

\[ G_{d}^{(a)}(t) \in (L^{2,d}), \quad d = 1, 2. \]

**Proof.** From (3.3) we have

\[ G_{d}^{(a)}(t) \sim \left( \int_{0 \leq u < v \leq t} \frac{1}{(2\pi)^{2/d}} \exp \left( - \sum_{j=1}^{d} x_{j}^{2} \right) e_{a_{j}}(x_{j}) \prod_{j=1}^{d} 1^{\otimes n}_{(u,v)} \frac{1}{(v-u)^{(n+d)/2}} \, du \, dv \right), \]

where \( x_{j} = \frac{a_{j}}{\sqrt{2(v-u)}} \) and the first term is considered as zero when \( a = 0 \) and \( d = 2. \) Hence,
\[
\left\| G_d^{(a)}(t) \right\|_2^2 = \sum_{n=n_0}^{\infty} \sum_{n_1+\cdots+n_d=n} \left| \int_{0\leq u<v\leq t} e^{-\frac{\xi^T \eta}{2}} \frac{d}{(2\pi)^{d/2}} \prod_{j=1}^{d} e_{n_j}^2(x_j) \frac{1}{(v-u)^{(n+d)/2}} \, dudv \right|^2
\]

\[
\leq C \left( 1 + \sum_{n=n_0}^{\infty} \sum_{n_1+\cdots+n_d=n} (2\pi)^{-d} \prod_{j=1}^{d} (n_j)^{-1/6} a_{n/2}^{(d)}(t) \right)
\]

\[
\leq C \left( 1 + \sum_{n=n_0}^{\infty} \sum_{n_1+\cdots+n_d=n} n^{-2} \prod_{j=1}^{d} n_j^{-1/6} \right)
\]

\[
\leq C \left( 1 + \sum_{n=n_0}^{\infty} \sum_{n_1+\cdots+n_d=n} \prod_{j=1}^{d} n_j^{-1/6} n_j^{-1} \right)
\]

\[
\leq C \left( 1 + \sum_{n=n_0}^{\infty} n^{-7/6} \right)^d < \infty,
\]

where

\[
n_0 = \begin{cases} 
1, & a = 0 \text{ and } d = 2, \\
0, & \text{otherwise}
\end{cases}
\]

and \(C\) is a constant depending on only \(d\) and \(t\), but may vary in different expressions. Thus \(G_d^{(a)}(t) \in (L^2, d)\) for \(d = 1, 2\).

\[\square\]

Based on Lemma 2, it is plausible to reason that Theorem 3 does not hold for \(d \geq 3\).

**Theorem 4.** For any bounded Borel function \(f\) and \(t > 0\)

\[
\int_{0 \leq u < v \leq t} f(B_v - B_u) \, dudv = \begin{cases} 
\int_{R^d} f(a) G_1^{(a)}(t) \, da, & d = 1, \\
\int_{R^d} f(a) G_2^{(a)}(t) \, da, & d = 2.
\end{cases}
\]

(3.22) is the so-called Tanaka’s formula.

**Proof.** We only give the proof for \(d = 2\). We show the \(S\)-transforms of the two sides of (3.22) are the same. Let \(\xi = (\xi_1, \xi_2) \in \mathcal{S}(R) \times \mathcal{S}(R)\). Then

\[
\left[ S \left( \int_{R^d} f(a) G_2^{(a)}(t) \, da \right) \right] (\xi) = \int_{R^d} f(a) [S(G_2^{(a)}(t))] (\xi) \, da
\]

\[
= \int_{R^2} \int_{0 \leq u < v \leq t} \frac{f(a)}{2\pi (v-u)} \exp \left\{ -\frac{1}{2(v-u)} \sum_{j=1}^{2} (a_j - \int_u^v \xi_j(r) \, dr)^2 \right\} \, dudvda
\]

\[
= \int_{0 \leq u < v \leq t} \left[ T_{v-u}^{(2)} f \right] \left( \int_u^v \xi(r) \, dr \right) \, dudv.
\]
On the other hand,
\[
\left[ S \left( \int_{0 \leq u < v \leq t} f(B_v - B_u) \, du \, dv \right) \right](\xi) = \int_{0 \leq u < v \leq t} \left[ S(f(B_v - B_u)) \right](\xi) \, du \, dv
\]
\[
= \int_{0 \leq u < v \leq t} \left[ T_{u-u}^{(2)} f \left( \int_u^v \xi(r) \, dr \right) \right] \, du \, dv.
\]
Hence (3.22) follows. □

Even for \( d \geq 3 \) the Tanaka’s formula (3.22) holds, but the integrals in the right side of (3.22) should be understood in the sense of the Bochner integral in \( (S^d)^{-p} \) for any \( p > 0 \).

4. Local times

Compared with the results and proofs in the above section, we can easily obtain the following results:

1) For any \( d \geq 1, \ t \geq 0 \)
\[
L_d(t) = \int_0^t \left[ \delta(B_u) - \sum_{n=0}^{d-2} \sum_{n_1 + \cdots + n_d = n} I_{n_1, \ldots, n_d}(\phi_{n_1, \ldots, n_d}(0, u)) \right] \, du \in (\omega^d)^{\ast}.
\]
Naturally, \( L_d(t) \) may be considered as the local times at 0.

2) For any \( t > 0 \), \( L_1(t) \in (L^{2,1}) \). In fact, note that
\[
\left\| \int_0^t u^{-(n+1/2)} \frac{\partial^{2n}}{\partial u^{2n}} (\phi_{n_1, \ldots, n_d}(0, u)) \right\|_2 \leq \begin{cases} 4t \frac{2n + 1}{2n + 1}, & d = 1, \\ \infty, & d \geq 2. \end{cases}
\]
So even for \( d = 2 \), \( L_2(t), \ t > 0 \), are impossible to be ordinary Wiener functionals.

3) If \( a \neq 0 \), then for any \( t \geq 0, \ p > 0 \)
\[
L_d^{(a)}(t) = \int_0^t \delta_a(B_u) \, du \in (\omega^d)^{-p}
\]
is a Hida distribution. \( L_d^{(a)}(t) \) may also be considered as the local time at \( a \).

4) For any \( t > 0, \, a \in R, \ L_1^{(a)}(t) \in (L^{2,1}) \). In fact, noting that
\[
\int_{0 \leq u < v \leq t} \left[ \frac{1_{(0,u)}}{\sqrt{u}} \cdot \frac{1_{(0,v)}}{\sqrt{v}} \right]^n \, du \, dv = \frac{2t^2}{n + 2},
\]
it seems that for \( a \neq 0 \), \( L_2^{(a)}(t) \) may not be ordinary Wiener functionals.

For the case of \( d = 1 \) we can give another treatment. Kubo has established
the following generalized Itô’s formula (cf. [4]): for all \( f \in \mathcal{S}'(\mathbb{R}) \), \( 0 < s < t \),

\[
(4.1) \quad f(B_t) - f(B_s) = \int_s^t \partial_u^* f'(B_u) du + \frac{1}{2} \int_s^t f''(B_u) du.
\]

Take \( f(u) = u1_{(a,\infty)}(u) = (u - a)^+ \), then \( f' = 1_{(a,\infty)}, f'' = \delta_a \). Substituting them into (4.1) yields

\[
(4.2) \quad (B_t - a)^+ - (B_s - a)^+ = \int_s^t \delta_a 1_{(a,\infty)}(B_u) du + \frac{1}{2} \int_s^t \delta_a(B_u) du.
\]

Since \( 1_{(a,\infty)}(B_u) \) is adapted, letting \( s \to 0 \) in (4.2) yields

\[
L_2^a(t) = \int_s^t \delta_a(B_v) du = 2[(B_t - a)^+ - (-a)^+ - \int_0^t 1_{(a,\infty)}(B_u)dB_u] \in (L_2^1).
\]

This is just the ordinary definition of local times for one-dimensional Brownian motion. Obviously, we provide indeed a white noise analysis treatment of local times for one-dimensional Brownian motion. This approach applies also to local times of self-intersection for one-dimensional Brownian motion. In fact, by using (4.1) it is easy to get

\[
\int_{0 \leq u < v \leq t} \delta_a(B_v - B_u) dudv = 2 \left[ \int_0^t (B_t - B_u - a)^+ du - (-a)^+ - \int_0^t 1_{(a,\infty)}(B_v - B_u) dudB_v \right] \in (L_2^1).
\]
