

A writer's guide to education scholarship: Qualitative education scholarship (part 2)

Teresa M. Chan, HBSc, BEd, MD, MHPE*; Daniel K. Ting, MD[†]; Andrew Koch Hall, MD, MMed[‡]; Aleisha Murnaghan, BSc, MD, MHPE[§]; Brent Thoma, MD/MA, MSc[¶]; Jill McEwen, MD^{**}; Lalena M. Yarris, MD, MCR^{††}

ABSTRACT

Objective: Education scholarship can be conducted using a variety of methods, from quantitative experiments to qualitative studies. Qualitative methods are less commonly used in emergency medicine (EM) education research but are well-suited to explore complex educational problems and generate hypotheses. We aimed to review the literature to provide resources to guide educators who wish to conduct qualitative research in EM education.

Methods: We conducted a scoping review to outline: 1) a list of journals that regularly publish qualitative educational papers; 2) an aggregate set of quality markers for qualitative educational research and scholarship; and 3) a list of quality checklists for qualitative educational research and scholarship.

Results: We found nine journals that have published more than one qualitative educational research paper in EM. From the literature, we identified 39 quality markers that were grouped into 10 themes: Initial Grounding Work (preparation, background); Goals, Problem Statement, or Question; Methods (general considerations); Sampling Techniques; Data Collection Techniques; Data Interpretation and Theory Generation; Measures to Optimize Rigour and Trustworthiness; Relevance to the Field; Evidence of Reflective Practice; Dissemination and Reporting. Lastly, five quality checklists were found for guiding educators in reporting their qualitative work.

Conclusion: Many problems that EM educators face are well-suited to exploration using qualitative methods. The results of our scoping review provide publication venues, quality indicators, and checklists that may be useful to EM educators embarking on qualitative projects.

RÉSUMÉ

Introduction: Les travaux de recherche en enseignement peuvent être menés selon différentes méthodes, depuis les études expérimentales quantitatives jusqu'aux études qualitatives. Les méthodes qualitatives sont moins utilisées que les autres dans la recherche en enseignement de la médecine

d'urgence (MU), mais elles conviennent très bien à l'étude de problèmes complexes en enseignement et à l'émission d'hypothèses. Aussi avons-nous procédé à un examen de la documentation afin de proposer des ressources aux éducateurs qui désirent réaliser de la recherche qualitative en enseignement de la MU.

Méthode: Nous avons effectué un examen de la portée afin : 1) de dresser une liste de revues qui publient souvent des travaux de recherche qualitative en enseignement; 2) d'établir un ensemble de marqueurs de qualité s'appliquant à la recherche qualitative en enseignement et aux travaux scientifiques; 3) de relever des listes de vérification de la qualité s'appliquant à la recherche qualitative en enseignement et aux travaux scientifiques.

Résultats: La recherche a permis de recenser neuf revues qui avaient publié plus d'un travail de recherche qualitative en enseignement de la MU. Il s'est dégagé de l'examen de la documentation 39 marqueurs de qualité, groupés en 10 thèmes : les travaux préliminaires (les préparatifs, le contexte); le but, l'énoncé du problème ou la question; la méthode (généralités); la technique d'échantillonnage; la technique de collecte de données; l'interprétation des données et l'élaboration de théories; les mesures d'amélioration de la rigueur et de la véracité; la pertinence de la recherche dans le domaine; les signes de la pratique réflexive; la diffusion et l'établissement de rapports. Enfin se sont dégagées de la recension cinq listes de vérification de la qualité susceptibles d'aider les éducateurs dans l'établissement de rapports sur leurs travaux de recherche qualitative.

Discussion: De nombreux problèmes auxquels font face les éducateurs en MU se prêtent bien à la recherche menée à l'aide de méthodes qualitatives. L'examen de la portée a permis de relever différents éditeurs, des indicateurs de qualité et des listes de vérification susceptibles de guider les éducateurs en MU qui désirent faire de la recherche qualitative.

Keywords: qualitative research, education scholarship, academic writing

INTRODUCTION

Background

Medical education is a sizeable field that encompasses many research paradigms. One of the exciting areas of growth in the past 30 years has been the surge of work rooted in qualitative methods. Qualitative approaches stem from social science research practices. Rather than quantifying, predicting, or modeling outcomes, they aim to create a deep understanding of a situation or phenomenon.¹⁻³

These methods have been largely underused in emergency medicine (EM) medical education circles, but they have the opportunity of making a great impact on educational practice. Qualitative studies delve into the richness of complex phenomena, seeking to answer the “whys” and “hows.” These pursuits contrast with quantitative studies, which aim to answer focused questions (“Does this intervention work?”, “How much does this change that?”).⁴ In the past decade, there has been a growing interest in applying the qualitative paradigms to answer questions in the larger field of medical education,⁵⁻⁷ but there has been less uptake regarding qualitative methods in education papers within our specialty.

Despite this, a burgeoning respect for the use of qualitative approaches has developed in EM. In 2007, the Society of Academic Emergency Medicine (SAEM) consensus conference on knowledge translation affirmed that qualitative research has an important role for advancing the cause of translating knowledge to the bedside.⁸ Although this statement emerged from a broader context than EM education, it demonstrated an appreciation of the role of qualitative work in understanding the contextual nuances of implementing educational programs and inciting behavioural change. Since 2013, a group within the *Academic Emergency Medicine* journal has highlighted qualitative studies in their annual review of EM education papers.^{9,10}

Many qualitative methods draw from the social sciences, each method bringing with it the perspective of its originating field. Table 1 describes some of the commonly applied qualitative methods in education research and includes exemplar papers that fit within each paradigm.

Qualitative research often receives critique, especially from reviewers unfamiliar with these methods, regarding perceptions of excessive bias or anecdote, vague or heterogeneous methodology, and absence of external

validity or rigour.¹⁷ Fortunately, useful guides exist to help readers and reviewers better understand qualitative work such as the User's Guide series from *The Journal of the American Medical Association*.^{18,19} As these guides outline, qualitative research has its own set of rules that govern rigour, and threats to validity that can be addressed and minimized with thoughtful study design and execution.

This paper presents the results of a scoping review that aims to identify literature-based resources that EM educators may use to design, implement, and author qualitative research studies. Our literature search focused on a key primary question: what are the quality markers for qualitative educational research as described in the literature? We also explored the literature from our search to answer the following three secondary questions: 1) How frequently are qualitative papers published in EM journals? 2) Which journals regularly publish qualitative educational papers? 3) What are commonly used quality checklists for qualitative educational research?

METHODS

Literature search to identify relevant studies

We performed a scoping review using the approach described by Arskey and O'Malley.²⁰ We conducted an initial search using the MEDLINE database from the National Library of Medicine as well as the ERIC database in December 2015. Our search was limited to human and English language papers using “and/or” combinations of variations of the following keywords: *qualitative*, *emergency medicine*, *qualitative methods*, and *medical education*. An adjunctive search was undertaken via Google Scholar. Google Scholar has been previously noted in the literature as an alternative search method that can replace the use of other databases for review papers.²¹ In this instance, we used it to supplement our other database searches.^{22,23} The keywords *medical education*, *emergency medicine*, and *qualitative* were used. We did not specify a time period for publications and accessed all literature available in the MEDLINE and ERIC databases from their beginning date. A master list was created of all articles resulting from the three searches, duplicates were excluded, and a manual search of the references of final papers was conducted to identify additional papers to add to the master list.

Table 1. Key features of various qualitative methods			
Method	When you use this technique	Exemplar paper	"How to" papers
Grounded theory ^{2,11-13}	Generates theory in areas where little is known about the topic. Inductive analysis of the data is used to produce hypotheses, which are iteratively tested through further data collection.	Kennedy TJ, Lingard L, Baker GR, et al. Clinical oversight: conceptualizing the relationship between supervision and safety. <i>J Gen Intern Med</i> 2007; 22(8):1080-5.	Kennedy TJ, Lingard LA. Making sense of grounded theory in medical education. <i>Med Educ</i> 2006;40(2):101-8. Watling CJ, Lingard L. Grounded theory in medical education research: AMEE Guide No. 70. <i>Med Teach</i> 2012;34(10):850-61.
Ethnography ^{2,11-13} (including autoethnography ¹⁴)	Focuses on culture and understanding of how individuals interact within that culture. Observation is the key method of collecting data.	Nugus P, Holdgate A, Fry M, et al. Work pressure and patient flow management in the emergency department: findings from an ethnographic study. <i>Acad Emerg Med</i> 2011;18(10):1045-52.	Goodson L, Vassar M. An overview of ethnography in healthcare and medical education research. <i>J Educ Eval Health Prof</i> 2011;8:4. Farrell L, Bourgeois-Law G, Regehr G, et al. Autoethnography: introducing 'I' into medical education research. <i>Med Educ</i> 2015;49(10):974-82.
Phenomenology ^{2,11-13}	Explores a specific phenomenon and how it is experienced by participants (known as the "lived experience").	Babaria P, Abedin S, Nunez-Smith M. The effect of gender on the clinical clerkship experiences of female medical students: results from a qualitative study. <i>Acad Med</i> 2009; 84(7):859-66.	Stenfors-Hayes T, Hult H, Dahlgren MA. A phenomenographic approach to research in medical education. <i>Med Educ</i> 2013;47(3):261-70.
Action research ^{2,11}	Uses the research process to bring about a change in practice. Alternates between changes in a system and evaluation of that system.	Eisenberg EM, Baglia J, Pynes JE. Transforming emergency medicine through narrative: qualitative action research at a community hospital. <i>Health Commun</i> 2006;19(3):197-208.	Genn JM, Harden RM. What is medical education here really like? Suggestions for action research studies of climates of medical education environments. <i>Med Teach</i> 1986;8(2):111-24.
Narrative analysis ¹²	Examines how individuals use stories to interpret experiences.	Apker J, Mallak LA, Gibson SC. Communicating in the "gray zone": perceptions about emergency physician hospitalist handoffs and patient safety. <i>Acad Emerg Med</i> 2007;14(10):884-94.	Bleakley A. Stories as data, data as stories: making sense of narrative inquiry in clinical education. <i>Med Educ</i> 2005;39(5):534-40.
Mixed methods ^{13,16}	Strategically combines techniques from both quantitative and qualitative traditions to answer questions around a specific situation and/or phenomenon. Typically suggested when studying new areas or complex systems/ programs.	Papp KK, Stoller EP, Sage P, et al. The effects of sleep loss and fatigue on resident-physicians: a multi-institutional, mixed-method study. <i>Acad Med</i> 2004;79(5):394-406.	Schifferdecker KE, Reed VA. Using mixed methods research in medical education: basic guidelines for researchers. <i>Med Educ</i> 2009;43(7):637-44.
Case studies ²	These allow in-depth analysis of a single particular case.	Gagnon MP, Duplantie J, Fortin JP, et al. Exploring the effects of telehealth on medical human resources supply: a qualitative case study in remote regions. <i>BMC Health Serv Res</i> 2007;7:6.	Rowley J. Using case studies in research. <i>Management Research News</i> 2002;25(1):16-27. (Not from medical education literature)

Selection of articles for the scoping analysis

Two investigators (TMC, DKT) performed the literature search and reviewed titles for relevancy. For the scoping analysis, we included all papers that provided guidance to authors wishing to conduct, report, or write qualitative studies or educational scholarship. We did not limit the inclusion of articles to EM literature, and instead looked more broadly into the general medical and medical education literature. We excluded papers that merely used qualitative methods. These excluded papers were kept and used for the frequency analysis, which is mentioned later in our methods. To ensure interrater consistency, the first 100 titles obtained from the MEDLINE search were reviewed together to determine consensus on which types of titles were to be included or excluded.

Charting and analysis of the quality markers

Our primary aim was to develop a literature-based set of quality markers for qualitative research, which we defined as items that were written as advice to authors of qualitative research that were not already within known qualitative scoring systems. To identify candidate quality markers, a single investigator (TMC) read the full-text articles remaining from the literature search after inclusion criteria were applied. Quality markers mentioned in the text, diagrams, figures, or tables were extracted into a master list.²⁴ These quality markers were combined into one single master list, and then a close analysis was performed by a single investigator (TMC) to group and reduce this list in the manner described by Arskey and O'Malley into its final form.²⁰ To enhance the rigour of this analysis, two investigators (DKT, JM) surveyed the analysis audit trail (i.e., the analysis documents) after reviewing the 11 full-text articles.

Qualitative publishing frequency and journal identification

To identify journals that publish qualitative research relevant to EM education, we determined the overlap of qualitative medical education research papers and qualitative research in EM. This frequency analysis was done with medical education papers using qualitative methods that were found in our initial literature search, but which were excluded from the scoping analysis.

After merging the results of the three database searches and excluding duplicates, the citations were manually sorted using the Mendeley reference software into mutually inclusive categories of “qualitative research,” “medical education,” “emergency medicine,” or combinations of these two groupings (i.e., “qualitative research and emergency medicine” or “medical education and emergency medicine”). When the article title resulted in ambiguous characterization, the abstract or full-text was reviewed. We then generated a list of journals that had published at least one qualitative research articles relevant to EM medical education. From this list, we also produced a subset of journals with at least two qualifying publications.

Quality checklist identification

The manuscripts reviewed in the full-text phase were read in total by two authors (TMC, JM), and papers with relevant checklists were extracted.

RESULTS

Citations totalling 1,337 were obtained from our search strategy. These papers were reviewed for duplication and then subjected to the inclusion and exclusion criteria. Figure 1 depicts how papers were removed at various stages to arrive at the final set of full-text papers used for the scoping analysis ($n = 11$).

Quality markers for qualitative studies

We reviewed 62 papers in full-text form for quality markers. Of these, 11 papers had specific items that could be extracted for the close analysis. Appendix A lists the 11 papers. Table 2 contains the results of our thematic analysis of quality markers in qualitative research, based on the close analysis of relevant papers from our literature review.

Quantifying the qualitative publishing rates

Our literature search revealed a separate set of 387 citations of EM qualitative research papers and 314 of EM medical education papers; 59 citations overlapped between these two categories, which represent qualitative education research relevant to EM (Figure 2).

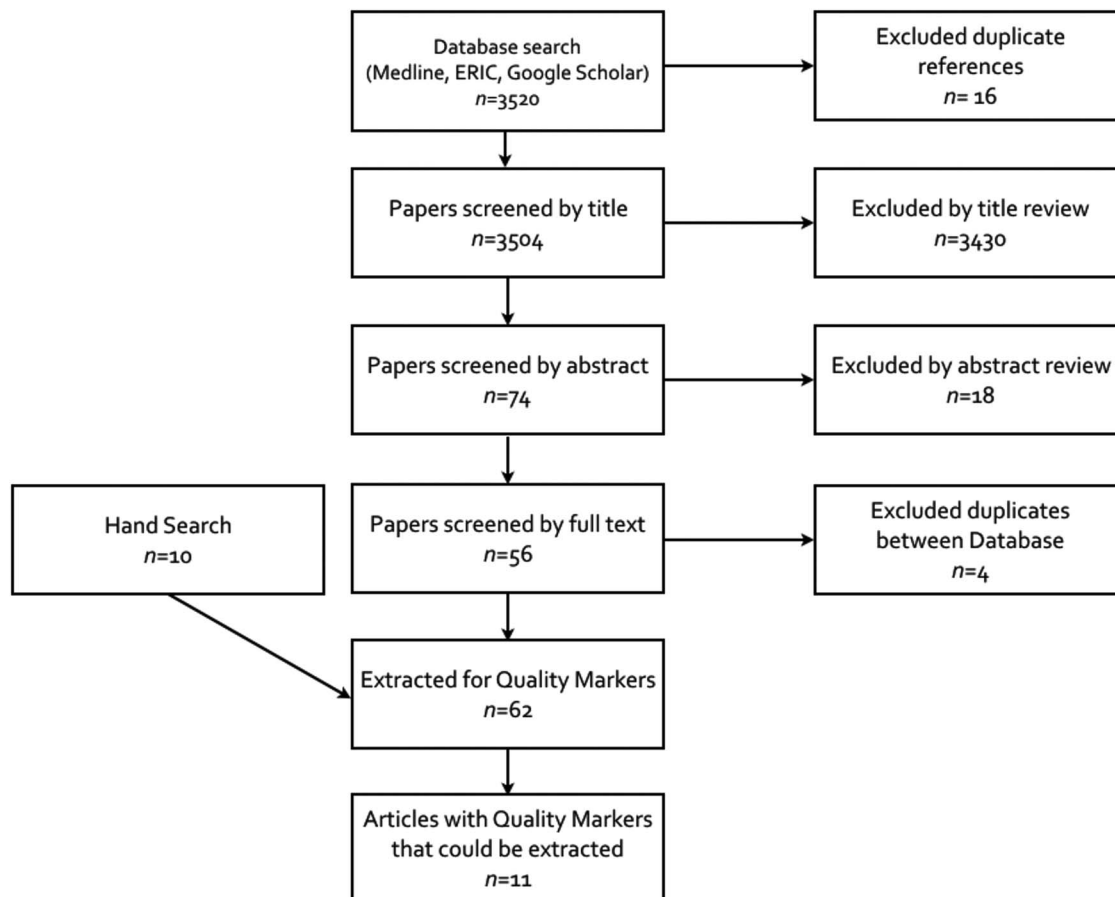

Figure 1. Flow diagram for literature review.

Checklists for quality

Our search identified five papers that had developed and reported checklists or scoring metrics useful for evaluating qualitative research (Table 3). The fifth paper by Sullivan et al. reported features useful for determining quality and value of both qualitative and quantitative research. These checklists would all be useful for consultation when designing a qualitative study, writing and editing manuscripts, performing editorial review of manuscripts, and performing critical appraisal of a qualitative paper.

We found 33 journals that publish EM qualitative research in medical education (Appendix B). Of these, 9 journals had at least two qualifying papers, as listed in Table 4.

DISCUSSION

Qualitative methods have the potential to provide us with new insight and clarity into the educational

problems and dilemmas that we face within our specialty. As illustrated in Table 1, there are wide ranges of research methods that can be used to answer questions within the field of medical education. Furthermore, as evidenced by Table 4 and Appendix B, there are an increasing number of medical journals amenable to publishing rigorous qualitative work in EM and medical education. Figure 2 depicts that approximately 18.9% (59/314) of the EM education papers in our literature search were qualitative in nature. Similarly, we found that a slightly smaller proportion of EM qualitative papers (15.2% [59/397]) were educational papers. Taken together, our findings suggest that, despite a growing interest, only a minority of studies use qualitative methods. Given that many educational problems involve emerging theory or little understood phenomenon, we propose that qualitative methods are under-used in EM education.

Interestingly, our thematic analysis of the 11 papers with advice and tips for writing qualitative methods yielded disparate items from those addressed in the

Table 2. Markers of quality in qualitative education research studies

Category	Item
Initial grounding work (preparation, background)	<ul style="list-style-type: none"> • Adequate preparation²⁵ that includes a thoughtful, focused, up-to-date review of the literature^{7,26} (unless technique requires deliberate distancing from prior experience). • A conceptual linkage to existing theory.²⁷
Goals, problem statement, or question	<ul style="list-style-type: none"> • Declaration and report of one's theoretical paradigms and values,²⁸ or position.²⁸ • Clear statement of the research goals^{25-27,11} and research questions^{27,29} – point out that as the study is inductive, there are no hypotheses.¹¹ • The problem is important, timely, relevant, critical, and prevalent.²⁶ • Clear articulation of the research questions²⁹ or goals.²⁵
Methods (general)	<ul style="list-style-type: none"> • Appropriate methods²⁵ are justified²⁷ (i.e., why is a qualitative approach the best option to answer your question?²⁷ Why was the particular qualitative design chosen?²⁷). • Clear methodology²⁸ (i.e., clearly describe the sampling, data collection, data analysis/interpretation, and methods for establishing rigour). • Explanation that, as the approach is inductive, the methods, tools, and approaches may have changed as the study progressed.¹¹ • Report ethical approval²⁷ or waiver from an appropriate institution.
Sampling technique	<ul style="list-style-type: none"> • Use of a sampling plan²⁹ that ensures participants are relevant to the research question or problem statement¹⁸ and that their selection is well reasoned,¹⁸ because qualitative studies are more likely to focus on a social world or phenomenon rather than a specific population.¹¹ • Sampling should be guided and selective.³⁰ Theoretically driven,¹¹ purposive/purposeful sampling,³⁰ or snowball sampling^{11,30} may be better than random or convenience sampling. • Sample size sufficiently large²⁶ but driven by saturation¹¹ or other analysis-driven phenomena. • Description of sampling technique,²⁷ including whether the sample has changed and developed over the course of your study.¹¹ • Flexible participant recruitment and setting to maximize participation (e.g., choose locations that make participants feel welcome).³⁰
Data collection technique	<ul style="list-style-type: none"> • Clear articulation of data collection strategies.^{27,29} • Appropriate data collection methods for the research objectives and setting (three main subtypes are mentioned – field observation, interviews, document analysis)^{18,30}: <ul style="list-style-type: none"> ◦ Focus groups – not substitute for one-to-one interviews or a survey. Useful for what participants think, but even better at uncovering why participants think as they do. • Comprehensive data collection to support rich and robust descriptions of the observed/experienced events or phenomena.¹⁸ • Use of piloting collection tools – piloting your scripts (e.g., for focus groups) ensures rigour of our questioning technique.³⁰
Data interpretation & theory generation	<ul style="list-style-type: none"> • Systematic data analysis^{11,28} that aligns with analytic processes with known methods to ensure: <ul style="list-style-type: none"> ◦ Appropriate reduction and displaying of the collected data – identifying key categories and representing these appropriately.¹¹ ◦ Conclusions are drawn from analysis category clusters.¹¹ • Linkages made between the findings of the study and other existing theories OR development of new theory relevant to targeted field/discipline.²⁷ • Evaluation of observations and theorems³¹ or theory development^{27,31} when appropriately given the selected analytic technique (e.g., grounded theory).
Measures to optimize rigour & trustworthiness	<ul style="list-style-type: none"> • Data analysis uses methods that establish trustworthiness throughout the study,^{28,29} detailing methods that adequately corroborate¹⁸ or confirm³⁰ the investigator's findings. • Use of reflexivity^{28,11} by investigators, specifically: <ul style="list-style-type: none"> ◦ Clear statement of the effect on the data of the researcher's views and the methods chosen that have been included.²⁷ ◦ Explicit evaluation of the relationship between the researcher and those under research, addressing any ethical issues.²⁷ • Using one or more of the following techniques to increase rigour of the analysis:¹¹ <ul style="list-style-type: none"> ◦ Saturation¹¹ ◦ Triangulation^{11,28}

Table 2. (Continued)	
Category	Item
Relevance to the field	<ul style="list-style-type: none"> ○ Respondent feedback (“member checking”)¹¹ ○ Fair dealing¹¹ • If multiple methods are in used to increase the rigour of the work, clear description of each method, including their benefit – e.g., source triangulation, allows to examine the issue from multiple types of data collection.¹¹ • Significant results.²⁵ • Assessment of transferability to other similar environments.^{27,31} • Practical, useful implications.²⁶ • Comprehensive and relevant theoretical conclusions.¹⁹ • Evocative and thorough description of results.¹⁹ • Insight into context of medical practice.¹⁹
Dissemination & reporting	<ul style="list-style-type: none"> • Effective presentation.²⁵ • Well-written manuscript (clear, straightforward, easy to follow, logical).²⁶ • Clear explanation of technical language – e.g., explaining terms such as <i>saturation</i>.¹¹
Evidence of reflective practice	<ul style="list-style-type: none"> • Reflective critique²⁵ of one’s own study, particularly evaluating other findings in similar contexts to examine whether the results are easily transferable across settings.²⁷ • Account of the limitations of the study.²⁶

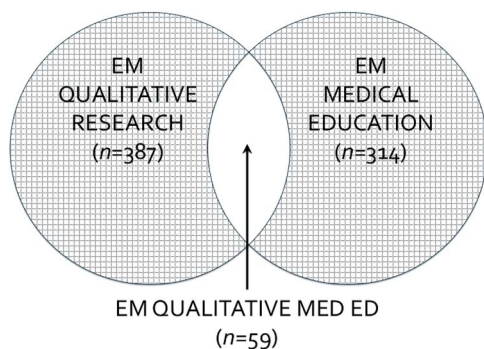

Figure 2. Number of emergency medicine, qualitative and medical education papers in our literature search.

checklists described in Table 3. Some of the items that we found were broader in their scope (i.e., more general guidance) around important aspects to consider when writing a qualitative paper. As such, we feel that the list generated by our present scoping review may help augment the advice presented by the previous literature, because it aggregates the wisdom reported in papers that may not have been used to inform the creation of previous checklists (e.g., the SRQR).³²

There are, however, a number of challenges and barriers to using qualitative research.¹⁷ For instance, researchers using these techniques must be tolerant of ambiguity and be comfortable in presenting non-numerical data. Also, unlike quantitative studies, researchers must be intimately involved in the

generation and interpretation of data.⁶ Swaths of work cannot simply be outsourced to a junior collaborator or a hired statistician. Finally, regardless of the type of medical education scholarship, novice educators may find it difficult to get their research published, whether they are engaged in qualitative methods or not.³³

This scoping review and adjunctive analyses provide resources that may be useful to educators in designing, implementing, and writing up qualitative research. Attention to quality indicators and awareness of available checklists and publication venues may help educators overcome common obstacles to publication, and increase interest and engagement in qualitative research.

LIMITATIONS

This paper provides a literature-informed review of existing guides for conducting and authoring qualitative research in EM. Although it cannot replace formal methodological training and mentoring, it may serve as a complementary resource that can scaffold early career and new qualitative scientists when writing within medical education. Although efforts were made to systematically search the literature, it is possible that relevant publications could have been missed, especially because our search was restricted to the English-language only. In addition, inclusion processes and thematic analyses do involve researcher involvement in

CONCLUSIONS

There are many papers to guide early education researchers towards reporting and conducting high quality qualitative research. We have reported 39 quality markers that should be considered when authoring qualitative medical education studies, which we have grouped into 10 key categories. Additionally, we present five previously published quality checklists, which will assist authors in preparing qualitative manuscripts for publication. Our paper may serve as a primer for early career educators who aim to enhance the rigour of their qualitative educational research.
