

we will need to be able to flexibly read and discuss studies at other levels of analysis than those we use.

Because of the length of the book, it is difficult to suggest topics that could have been expanded. Chapters were uneven, however, in the degree to which they bridged between basic neuroscience and cognition. For instance, some but not all of the primary sensory chapters discussed how the information could be applied to the findings of higher-order cognitive studies. Likewise, some, but not all, cognitive and neural modelling chapters referred back to the neural underpinnings of the behaviors. Similarly, some of the chapters on development lacked sufficient

neural information to warrant inclusion in a book on cognitive neuroscience.

Finally, my fears. This book serves as the latest, up-to-date review of a newly constituted field, cognitive neuroscience. Given the speed with which this field is moving, fueled in part by new brain imaging techniques, it will be a challenge on the editor's part to keep the book as up to date as it is at the moment.

In summary, this is an excellent reference that is jam-packed with information. So reinforce your bookshelves for the weight of this book and reinforce your mind for its content.

ERRATUM

The following is the correction for a printing error that occurred in the *Journal of the International Neuropsychological Society*, Vol. 1, No. 6. On page 597 in the review by Dr. Dean C. Delis titled "Evaluating the Brain's Mind," Dr. Muriel D. Lezak is listed as the editor of the book *Neuropsychological Assessment*. She is, in fact, the author and not the editor. Cambridge University Press apologizes for this error.
