(Received 24 June 2022; accepted 21 August 2022)

The crystal structure of altrenogest has been solved and refined using synchrotron X-ray powder diffraction data, and optimized using density functional techniques. Altrenogest crystallizes in space group P₂₁̅₂₁₂₁ (#19) with a = 7.286916(16), b = 10.580333(19), c = 22.26668(7) Å, V = 1716.671(6) Å³, and Z = 4 at 295 K. Thermal expansion between 113 and 295 K is anisotropic. An O⋯H⋯O hydrogen bond links the molecules into chains along the c-axis. The powder pattern has been submitted to ICDD for inclusion in the Powder Diffraction File™ (PDF®).

Key words: altrenogest, Altren, powder diffraction, Rietveld refinement, density functional theory

Altrenogest (Figure 1; sold under the brand names Swinemate, Altren, and Regumate) is a steroidal progestin that is widely used in veterinary medicine to suppress estrus (female sexual activity) in mammals. The systematic name (CAS Registry Number 850-52-2) is (8S,13S,14S,17R)-17-hydroxy-13-methyl-17-prop-2-enyl-1,2,6,7,8,14,15,16-octahydrocyclopenta[a]phenanthren-3-one. This work was carried out as part of a project to determine the crystal structures of large-volume commercial pharmaceuticals, and include high-quality powder diffraction data for them in the Powder Diffraction File (Gates-Rector and Blanton, 2019).

The synchrotron pattern (measured at 11-BM at APS using a wavelength of 0.458208 Å) of a commercial reagent (purchased from TargetMol, lot #113704) was indexed on a primitive orthorhombic unit cell having a = 7.28545, b = 10.60836, c = 22.29364 Å, V = 1723.0 Å³, and Z = 4 using JADE Pro 8.1 (MDI, 2021). The suggested space group was P₂₁̅₂₁₂₁ (#19). The structure was solved by Monte Carlo simulated annealing techniques as implemented in EXPO2014 (Altomare et al., 2013), with a success rate of ~30%; 30% of the trials yielded an essentially identical correct structure. The structure was refined using GSAS-II (Toby and Von Dreele, 1996). After refinement, a repeated reduced cell search in the Cambridge Structural Database (Groom et al., 2016) yielded a very recent private communication to the CSD (Cui, 2021; Refcode OPOGIM) of the structure of altrenogest at 113 K.

The powder pattern of altrenogest calculated from the 113 K structure of OPOGIM exhibits significant peak shifts, compared with the pattern measured at ambient conditions (Figure 2). The thermal expansion is anisotropic (Table I). It is largest in the b-direction, along which the molecules are stacked. The smallest expansion is along the c-axis, which represents end-to-end contacts. There is one traditional hydrogen bond (Table II) between the hydroxyl group O1⋯H41 and the carbonyl group O2. These link the molecules into chains parallel to the c-axis with a graph set C1,1(12) (Etter, 1990; Bernstein et al., 1995; Shields et al., 2000). Two C⋯H⋯O and one C⋯H⋯C hydrogen bonds also contribute to the lattice energy.

I. DEPOSITED DATA

The Crystallographic Information Framework (CIF) files containing the results of the Rietveld refinement (including the raw data) and the DFT geometry optimization were deposited with the ICDD. The data can be requested at info@icdd.com.

ACKNOWLEDGEMENTS

The use of the Advanced Photon Source at Argonne National Laboratory was supported by the U.S. Department of Energy, Office of Science, Office of Basic Energy Sciences, under Contract No. DE-AC02-06CH11357. This work was partially supported by the International Centre for Diffraction Data. We thank Lynn Ribaud and Saul Lapidus for their assistance in the data collection.

CONFLICT OF INTEREST

The authors have no conflicts of interest to declare.
