## On the Pascal Hexagram.

By Prof. J. Jack.
§ 1. Proof in case of the circle.

## Figure 9.

ABCDEF is any cyclic hexagon;
$A B, D E$ meet in $G$,
BC, EF " , H,
CD, FA " , K ; then G, H, K are in a straight line.
Draw KLNM parallel to BC and produce DE, EF, AB to meet it in $\mathrm{I}_{\Omega}$ N, M. Join DA, DM and let BC, DE meet in P.
$\angle \mathrm{PCD}=\angle \mathrm{BAD} \quad \because \mathrm{ABCD}$ is a cyclic quadrilateral,
and $\angle \mathrm{PCD}=\angle \mathrm{DKM} \quad \because \mathrm{KM}$ is parallel to $\mathbf{C B}$;
$\therefore \angle \mathrm{BAD}=\angle \mathrm{DKM} ; \therefore$ DAMK is a cyclic quadrilateral.
Again $\angle \mathrm{DEH}=\angle \mathrm{DAK} \because$ AFED is cyclic ;
and $\angle \mathrm{DMN}$, i.e., $\angle \mathrm{DMK}=\angle \mathrm{DAK} \because$ DAMK is cyclic $;$
$\therefore \angle \mathrm{DEH}=\angle \mathrm{DMN}$ and $\therefore$ DMNE is cyclic.
$\operatorname{Again} \frac{\mathrm{PB}}{\mathrm{PE}}=\frac{\mathrm{PD}}{\mathrm{PC}}=\frac{\mathrm{DL}}{\mathrm{LK}}$ and $\frac{P E}{P H}=\frac{L E}{L N}=\frac{L M}{L D} ; \therefore \frac{P B}{P H}=\frac{L M}{L K}$;
$\therefore \mathrm{G}, \mathrm{H}, \mathrm{K}$ are in a straight line.

Figures 10 and 11.
$\S 2.0$ is any point on a chord $A B$ of a conic; the focus $S$, the directrix and $e$ are given; the eccentric circle of $O$ is described. Through O , radii $\mathrm{O} a, \mathrm{O} b$ are drawn parallel to $\mathrm{SA}, \mathrm{SB}$, in opposite
sense when O, S are on the same side of the directrix (Fig. 10) and in the same sense when on opposite sides (Fig. 11).

Then $a b$ passes through $S$.
For

$$
\frac{\mathrm{O} a}{\mathrm{OK} \sin \theta}=\frac{\mathrm{SA}}{\mathrm{AK} \sin \theta}
$$

$\therefore S, a, K$ are in a straight line. So $\mathrm{S}, b, \mathrm{~K}$ are in a straight line; $\therefore a b$ goes through S .
§3. Pascal's Theorem for the Conic (generally).
ABCDEF is any hexagon inscribed in a conic.
$\mathrm{AB}, \mathrm{DE}$ meet in $\mathrm{O}_{1} ; \mathrm{BC}, \mathrm{EF}$ meet in $\mathrm{O}_{2}$, and CD, FA meet in $\mathrm{O}_{3}$.

Then $\mathrm{O}_{1}, \mathrm{O}_{2}, \mathrm{O}_{3}$ are in a straight line.
The focus S , the directrix and $e$ are given.
Draw the eccentric circles of the points $\mathrm{O}_{1}, \mathrm{O}_{3}, \mathrm{O}_{3}$ and draw in each of the circles the six radii parallel to $S A, S B, S C, S D, S E$ and SF, in the opposite sense when $O$ and $S$ are on the same side of the directrix and in the same sense when $O, S$ are on opposite sides of the directrix.

Let the radii be $\mathrm{O}_{1} a_{1}, \mathrm{O}_{1} b_{1}$, etc. ; $\mathrm{O}_{2} a_{2}, \mathrm{O}_{2} b_{2}$, etc., etc.
Join the points $a_{1} b_{1}, b_{1} c_{1}, c_{1} d_{1}, d_{1} e_{1}, e_{1} f_{1}, f_{1} a_{1}$;

$$
\begin{aligned}
& a_{2} b_{2}, b_{2} c_{2}, c_{2} d_{2} \text {, etc., } \\
& a_{3} b_{3}, b_{3} c_{3}, c_{3} d_{3} \text {, etc. }
\end{aligned}
$$

Then the three cyclic hexagons $(a b c d e f)_{1},(a b c d e f)_{2},(a b c d e f)_{3}$ are similar and similarly situated.

Let $a_{1} b_{1}, d_{1} e_{1}$ meet in $g_{1}$,

$$
b_{1} c_{1}, e_{1} f_{1} \quad \# \quad \# h_{1}
$$

and $c_{1} d_{1}, f_{1} a_{3}, \quad,, k_{1}$,
and similarly for the other two hexagons let the corresponding sides meet in $g_{2}, h_{2}, k_{1}$ and $g_{3}, h_{3}, k_{3}$.

Then $g_{2} h_{1} k_{1}, g_{2} h_{2} k_{2}, g_{3} h_{3} k_{3}$ are straight lines by the proof of the theorem in the case of a circle.

Now from the nature of the eccentric circle, $a_{1} b_{1}, d_{1} e_{1}$ meet in S , that is, the point $g_{1}$ is S .

| Similarly | $"$ | $"$ | $h_{2}$ is S |
| :---: | :---: | :---: | :---: |
| and | $"$ | $"$ | $k_{3}$ is S. |

Hence the three straight lines, $g_{1} h_{1} k_{1}, g_{2} h_{2} k_{2}, g_{3} h_{3} k_{3}$ have one point $S$ common and they are parallel, because the figures are similar and similarly situated;

## $\therefore$ the three lines are coincident.

Now taking the three triangles $\mathrm{O}_{1} a_{1} g_{1}, \mathrm{O}_{2} a_{2} g_{2}, \mathrm{O}_{3} a_{3} g_{3}$ which are similar, we have

$$
\frac{\mathrm{O}_{1} g_{1}}{\mathrm{O}_{1} a_{1}}=\frac{\mathrm{O}_{2} g_{2}}{\mathrm{O}_{2} a_{2}}=\frac{\mathrm{O}_{2} g_{3}}{\mathrm{O}_{3} a_{3}}
$$

and if $\mathrm{O}_{1} m_{1}, \mathrm{O}_{2} m_{2}, \mathrm{O}_{3} m_{3}$ are the perpendiculars from $\mathrm{O}_{1}, \mathrm{O}_{2}, \mathrm{O}_{3}$ to the directrix, we have

$$
\frac{\mathrm{O}_{1} a_{1}}{\mathrm{O}_{1} m_{1}}=\frac{\mathrm{O}_{2} a_{2}}{\mathrm{O}_{2} m_{2}}=\frac{\mathrm{O}_{3} a_{3}}{\mathrm{O}_{3} m_{\mathrm{s}}}=e ;
$$

it therefore follows that

$$
\frac{\mathrm{O}_{1} g_{1}}{\mathrm{O}_{1} m_{1}}=\frac{\mathrm{O}_{2} g_{2}}{\mathrm{O}_{2} m_{2}}=\frac{\mathrm{O}_{3} g_{3}}{\mathrm{O}_{3} m_{3}} ;
$$

$\therefore \mathrm{O}_{1}, \mathrm{O}_{2}, \mathrm{O}_{3}$ are in a straight line, and it passes through the point in which the Pascal line of the cyclic hexagons meets the directrix.
