

Mind Children

The Future of Robot and Human Intelligence

Hans Moravec

© 1988 S. Anaheim California

Written by the renowned roboticist, Hans Moravec (Director of the Mobile Robot Laboratory of Carnegie-Mellon University), *Mind Children* offers a mind-boggling glimpse of a world we may soon share with our artificial progeny. Moravec argues that within fifty years we will achieve human equivalence in our machines, not only in their capacity to reason, but also in their ability to perceive, interact with, and change their environment.

But human equivalence is just the beginning. Moravec challenges us, as we approach the end of this millennium, to speculate about this postbiological future and the ways in which our own minds might participate in its unfolding. \$18.95 cloth

Biological Cybernetics

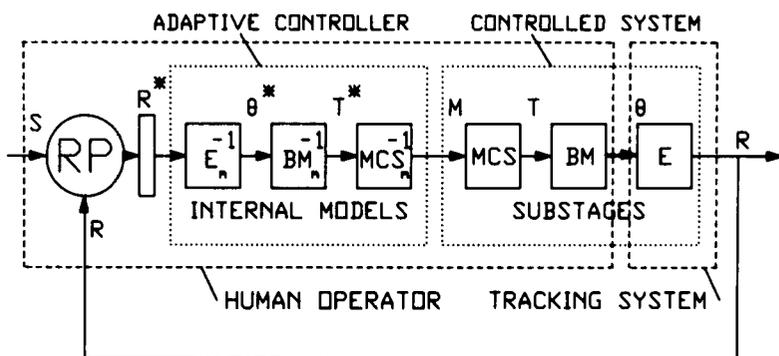

Communication and Control in Organisms and Automata

The concepts of processing of information, transmission of information and automatic control originated within physics, computer science and technology. In the meantime these concepts have also proved powerful in the biological sciences, where analogous processes are encountered. Many logical procedures, and mathematical techniques applicable to the physical sciences also find important applications in the realm of the life sciences. Conversely, physicists, computer scientists and engineers have shown increasing interest in natural mechanisms of computation, communication and control.

A fundamental idea that has emerged from the field of computer science and artificial intelligence is that information processing tasks must be understood independently of the physical mechanisms that embody the computations. As a consequence, a new computational science of information processing is now taking shape with important implications for both neurobiology and artificial intelligence. Furthermore, there is now a growing need in the area of basic sciences and for applications, such as robotics, of understanding the computations involved in perceptual and motors tasks, independently of whether they are carried out by organisms or by machines.

Notes for Contributors

1. Manuscripts should preferably be written in English, but papers in French and German will also be accepted. All manuscripts will be referred to acknowledged experts in the subject. Only those receiving favourable recommendations from the referees will be accepted for publication. Manuscripts may be sent to any Board member, any Deputy Editor or the Editor.

2. Typescripts should be double spaced, on one side of good grade paper, allowing a reasonable left-hand margin. An original and two copies should be submitted with the author's full postal address, position and affiliations.

3. A short abstract of about 80 words should precede the main text. *List of symbols:* A typewritten list of any special symbols should be submitted with the manuscript. The list should not define the symbols mathematically, but should serve to identify them typographically. The list will not appear in print, but is essential to help the typesetter and to avoid costly correction in proof.

4. One copy of photographs, prints or transparencies of good quality and unmarked should be submitted. Where lines or lettering are to appear on the photograph, an additional print should be supplied appropriately marked. Each should have, lightly written on the back, the author's name, the figure number and an indication of which is the top of the picture.

5. One copy of each line diagram should be submitted at approximately twice final size and unlettered. Diagrams must be drawn in indian ink on plain white or transparent paper. A second copy should be supplied with lettering included. The author's name and the figure number should be written on this copy. Figures should be numbered consecutively, with arabic numerals, have descriptive captions, and be mentioned in the text. The correct position for each figure should be indicated in the margin of the manuscript.

6. Tables should be typewritten on separate sheets. Avoid, where possible, very wide tables. Number tables

consecutively with roman numerals. Each should have a brief heading. Exceptionally lengthy tables may be summarized for publication with a note that copies of details can be obtained from the authors.

7. Equations: Wherever possible, mathematical equations should be typewritten, with subscripts and superscripts clearly indicated. The printer will set all mathematical symbols in italics unless otherwise indicated; symbols or letters to be set in roman (upright) type should be encircled in pencil, while bold letters should be shown by a wavy underline.

8. References: In the text, references are indicated by superior arabic numbers (without brackets), and should be confined to publish work that is directly pertinent. References should be listed at the end of the paper in numerical order. Authors' initials should precede their names; cited article titles should be quoted in full, enclosed in quotation marks; and abbreviations of journal names should follow the style of *Chemical Abstracts* or *Physical Abstracts*, and be underlined for italics: P.W. Anderson, "More is different" *Science* **177**, 393 (1972) C.V. Negoita, *Fuzzy Systems* (Abacus Press, Tunbridge Wells, UK, 1980)

Citations such as 'personal communication', 'unpublished work', etc., are not acceptable as numbered references but can be included in parenthesis in the text. Do not use summaries as references.

9. Proofs: Page proofs will be sent to authors for correction, for return within 48 hours by airmail. Correction to proofs should be restricted to printers' errors only. Authors are entitled to 25 offprints of their article free of charge. Additional offprints may be purchased if they are ordered on the form sent with the proofs.

10. Manuscripts, whether accepted or rejected, will not be returned to the authors.

11. Submission of an article will be taken to imply that it has not been previously published and that it is not on offer to any other publisher.

ROBOTICA

Volume 6 Part 4

October 1988

CONTENTS

Reports and Surveys (Computer Developments, Computer Integrated Manufacturing, Developments in Programming and Control in Manufacturing, Innovative Products and Projects, Optical Microchips, Robots Worldwide, Society of Manufacturing Engineers, Software Systems, Tele-Existence Systems, U.K. Robots Statistics, World Federation of Map/Top Users) B. H. Rudall (UK)	267
Robot ensembles for building construction, Murray A. Muspratt (USA)	275
Effect of sensor size in robotic tactile sensor arrays, A. W. De Groot (Canada)	285
Planning collision-free movements of a robot: A systems theory approach, W. Jacak, B. Łysakowska and I. Sierocki (Poland)	289
A note on planning station loading in flexible manufacturing systems, Gamini Gunawardane (USA)	297
Structure design and kinematics of a robot manipulator, Kesheng Wang and Terje K. Lien (Norway)	299
A new program package for the generation of efficient manipulator kinematic and dynamic equations in symbolic form, M. Kirćanski, M. Vukobratović, N. Kirćanski and A. Timćenko (Yugoslavia)	311
Intelligent adaptive control of a mobile robot: The automaton with an internal and external parameter approach, Jan Kazimierczak and Barbara Łysakowska (Poland)	319
Sample manipulation using robotic principles, J. Huddleston, N. R. Burgess and A. D. Walmsley (UK)	327
Intelligent robot programming: you can't get there from here—a viewpoint, S. T. Rock (South Africa)	333
Consistent impulse conditions in Lagrangian system dynamics, M. Cotsaftis and C. Vibet (France)	339
Book Reviews	343
Conference Report	350
Announcements	351
