pseudoscience that underpins the trauma industry and the resultant thoughtless ‘quick-fixes’ from many who ought to know better.

The atrocities she describes are apocalyptic in both scale and terror. In them, she endures personal hardships: living without running water, without electricity, yet aware of her privileged status, her passport, her choice to be there, her safe home in the UK. Jones is repeatedly drawn back to disaster scenes, not because of their horrors, but because, ‘I hope,’ she says, ‘that some [of their courage] will rub off on me’. In retelling these stories from her long humanitarian career, she passes some of that courage to her readers. Her beautifully written stories of a lone psychiatrist bearing children’s unbearable burdens are beacons of hope to their bomb-shattered childhoods and to our broken world.

Declaration of interest
In 2014, Jones and I were coincidentally participants on a memoir writing course run by the Guardian Newspaper. We have not remained in contact and she does not know I have read her book.

Student Mental Health: A Guide for Psychiatrists, Psychologists, and Leaders Serving in Higher Education

This is a comprehensive resource for professionals working with students in higher education. Subsections of the book address in turn the student experience, caring for students with mental health issues and how to foster mental health in distinct student populations. The book takes an academically robust approach to supporting student self-care, wellbeing and development of resilience.

Individual chapters go on to address key presentations around substance misuse, suicidality, mood and anxiety disorders, psychotic illness, autism, ADHD, trauma, sleep and eating disorders. There is also an important focus upon the role of university mental health services for students who have faced sexual violence, those from military backgrounds and first generation university attenders, as well as students identifying as part of the LGBTQ community. It is in the last chapter where the challenges for ‘medical students, residents and fellows’ are explored, albeit somewhat briefly. The writers identify the unique stressors for this group and reflect upon the obstacles to seeking help such as stigma and confidentiality. It is noteworthy that all medical students in the American system are postgraduate and therefore usually older than British students, most of whom enter medical school straight from sixth form/college and are less prepared for the expectations of professionalism at this early stage of their development.

Although written from the perspective of the American educational system, in general the content is still eminently transferrable to UK institutions. Throughout the book, its contributors make few assumptions as to prior knowledge, detailing everything from the risk-taking behaviours that develop during ‘emerging adulthood’ to the descriptive psychopathology for different major mental illnesses. Each chapter’s utilisation of key concept bullet points and case examples further increase its accessibility to the reader.

Ultimately the book makes recommendations not only on how student health programmes can achieve excellence by successfully managing students with major mental illness, but also on how all students can be supported to reach their full potential. It is a valuable resource for teachers in higher education.

The Whisperer
By Karin Fossum

How can we understand psychosis without experiencing it ourselves? How can we convey such a complex, bizarre and (as Jaspers would have it) un-understandable experience to others, particularly those new to psychiatry? It is a difficult task.

Karin Fossum, the respected Norwegian crime writer, does not shy away from confronting the more unpalatable aspects of the human mind. Her portfolio has included an exploration of the psychological motivation of paedophiles, elder abusers, and vulnerable people who are drawn into crime. Her focus is not on what, but why.
