This Society has lost one of its original members by the sudden death of Sir Dudley Stamp in Mexico City, at the age of 68, while attending a committee of the World Land Utilization Survey in August last.

A graduate of King's College in the University of London, as a geographer he had held his Chair at the London School of Economics for many years until he resigned some years ago to devote himself to the wider international field. Like many others, he began as a geologist. Many younger glaciologists will have seen him in action when, as President of the Royal Geographical Society at the time of the 1964 meeting of the International Geographical Congress in London, the duties of representing the host country frequently fell to him.

His lively and genial personality, reinforced by a supreme breadth of knowledge about the world and those who wrote about it, by a formidable energy and capacity for work, zest for travel and an accurate memory, was indeed widely appreciated. His accomplishment in developing studies of land utilization, starting from the great survey of Britain that he initiated in the depths of the 1931 depression, was justly honoured. He was one of the first
members to join this Society, and while his travels in his later years more commonly took him to the great cities of the world rather than the silent ice, he retained his sympathy with the aims of a new and developing branch of the earth sciences. It was characteristic of him that his interests should extend well beyond the particular field in which he was active. Many have benefited from his interest and advice and on more than one occasion this Society has been grateful for his influential assistance.

GORDON MANLEY
