the COVID 19 pandemic. In the US this data is not readily available at the time of submission for proper comparison.

**Conclusions:** Although definitive comparison is pending, the results of extensive illicit drug use demonstrate a high comorbidity with psychotic spectrum disorders in the DSM 5.

**Disclosure:** No significant relationships.

doi: 10.1192/j.eurpsy.2022.619

**Introduction:** Both alcohol use disorder (AUD) and depression are potentially disabling and economically burdensome disorders. There is no available information about the prevalence of alcohol use disorder in the general population of Latvia.

**Objectives:** To determine the 12-month prevalence of AUD and the association with depressive symptoms and socio-demographic factors among the Latvian general population.

**Methods:** Computer assisted face-to-face interviews were carried out in 2019-2020 among a representative sample of the Latvian adult population (n = 2687). The study sample was selected using a stratified random sampling method. The respondents were interviewed using the Patient Health Questionnaire-9 (a score of ≥ 10 was defined as indicating the presence of a clinically relevant depressive symptoms) and the Mini-International Neuropsychiatric Interview. Descriptive statistics and Chi-square test was applied.

**Results:** There were 1238 males (46.1%) and 1449 females (53.9%) recruited. Mean age of respondents was 49.9 (SD 18.2). The 12-month prevalence of AUD according to the M.I.N.I was 13.1% with a statistically significant difference between the genders: 23.6% in men and 4.1% in women (p<0.001). AUD was significantly more prevalent among the respondents younger than 40 years: 18.0% (p<0.001), especially among young (18-44 y.o.) men – 28.1% of all diagnosed cases (p<0.001); There was found an association between the severity stage of AUD and PHQ-9 screening results: 18.8% of those diagnosed with severe AUD had a score greater than 10 points in the PHQ-9 (p<0.001).

**Conclusions:** Young men are at particularly high risk of alcohol use disorder. Those with diagnosed alcohol use disorder should be also screened for the depressive symptoms.

**Disclosure:** No significant relationships.

Psychological Impacts on Patients with Alcohol Use Disorder: a Study in Southern Taiwan with Alcohol Use Disorders Identification Test (AUDIT) in 2020

1Jianan Psychiatric Center, Ministry of Health and Welfare, Forensic And Addiction Psychiatry, Tainan, Taiwan; 2Jianan Psychiatric Center, Ministry Health and Welfare, Forensic And Addiction Psychiatry, Tainan, Taiwan and 3Jianan Psychiatric Center, Ministry Health and Welfare, Consultant Physician, Tainan, Taiwan

doi: 10.1192/j.eurpsy.2022.620

**Introduction:** Alcohol consumption is a risk factor for various comorbidities, such as cirrhosis, chronic sclerosing stomatitis, and neuropsychiatric disorders.

**Objectives:** Our study examined the associations between psychological factors and alcohol addiction of the individuals with alcohol use disorder (AUD) in Southern Taiwan.

**Methods:** Demographic information as well as suicidal history and sources of stress were collected from 177 participants. The extent of alcoholism was assessed by AUDIT questionnaire. Demographic and linear regression analyses were performed with the Statistical Software Stata version 12.0 (StataCorp LP, College Station, TX, USA).

**Results:** Demographic data, suicidal history and the causes of stress of patients divided by AUDIT scores are shown in Table 1. Among 177 participants, 17 (9.6%) had suicidal thoughts, 4 (2.3%) had suicide plan, 22 (12.5%) self-injured, and four-fifth of patients lived under pressure. Patients who self-harmed were with significant lower AUDIT scores of -7.24 (95% CI: -11.49 – -3.00) (Table. 2). The AUDIT scores of patients with physical stress, interpersonal difficulties and loneliness increased significantly by 6.71 (95% CI: 3.19 – 10.30), 6.14 (95% CI: 2.15 – 10.13) and 5.02 (95% CI: 0.93 – 9.11), respectively (Table. 3).

**Conclusions:** Our findings indicated negative correlation with alcohol use and auto-inflicted injury. However, previous study showed systematic assessment of the association between suicide and AUD, and considered alcohol an important risk factor for suicide, which is related to mental health and affected by different genders and drinking patterns. Our results may provide reference for estimation of the alcohol-related psychological effects in Taiwan.

**Disclosure:** No significant relationships.

Are Neurotrophin Genes Involved in the Pathophysiology of Gambling Disorder?

I. Baenas1,2, N. Solé-Morata1, M. Etxandi1, R. Granero1,2,3, M. Gené1, C. Barrot4, P. Gorwood5, N. Ramoz5, F. Fernandez-Aranda1,2,6,7 and S. Jimenez-Murcia1,2,6,8

Introduction: Gambling Disorder (GD) is considered a multifactorial behavioral addictive disorder, leading to severe psychological, social and economic consequences. Previous studies have investigated genetic mechanisms underlying GD. Growing literature showed a possible link between addiction-related disorders and neurotrophic factors (NTF), involved in synaptic plasticity and neuronal survival. Thus, the study of NTF genes emerged as promising targets in the field of GD.

Objectives: To evaluate genetic implications of the NTF family in the pathophysiology of GD. We hypothesized the involvement of some NTF genes polymorphisms in the onset and progression of GD as potential biological risk factors.

Methods: The sample was composed by 166 individuals with GD and 191 healthy controls. 36 single nucleotide polymorphisms (SNPs) from NTF (NGF, NGFR, NTRK1, BDNF, NTRK2, NTF3, NTRK3, NTF4, CNTF and CNTFR) were selected and genotyped. Linkage disequilibrium and haplotype constructions were assessed, related to the presence of GD. Moreover, regulatory elements overlapping the identified SNPs variants associated with GD was also analyzed.

Results: 6 SNPs were potentially associated to GD after the comparisons of allele frequencies between groups. Single and multiple-marker analyses showed a strong association between both NTF3 and NTRK2 genes, and GD.

Conclusions: This study suggests the implication of NTF genes in the development of GD, being the altered cross-regulation of some NTF factors signalling pathways, a potential biological vulnerability factor in GD.
