Editorial

Record citations in 2007, but impact factor slips

Through publishing, authors disseminate their work in order that others may see it and act upon it in some way. This is one of the principal ways that the scientific community interacts and exchanges information. It has become increasingly important that the influence of an author’s body of work, or of an individual publication, or of an entire journal somehow be assessed. The importance of such an assessment is viewed differently in different countries, institutions and disciplines and by different individuals. For a number of years the Institute for Scientific Information (ISI) has released annual statistics on citations of articles published in previous years in scientific journals. A number of different summary statistics are produced, the most widely discussed being the impact factor. I have used previous editorials to keep readers informed of the most recent statistics for the British Journal of Nutrition (BJN) and to analyse them in relation to those of comparator journals and to temporal changes (1–3). The statistics for 2007 were published by the ISI in July 2008.

The BJN is listed in the Nutrition and Dietetics category of ISI Journal Citation Reports (5). In 2007 there were fifty-six journals listed in this category, including review journals and journals in the areas of obesity (for example, Obesity Research, International Journal of Obesity) and lipidology (for example, Progress in Lipid Research, Lipids). The impact factor of a journal is calculated as the number of citations of papers published in the previous 2 years divided by the number of papers published in those two years. Thus, the impact factor for 2007 (issued in 2008) is based upon the number of citations during 2007 of papers published in a particular journal in 2005 and 2006 divided by the number of papers published in that journal in 2005 and 2006. Clearly this favours very rapidly moving areas of research. Hence journals such as Nature, Science and Cell have high impact factors (28.75, 26.37 and 29.88, respectively, for 2007). For the past 6 years the two highest ranked journals in the Nutrition and Dietetics category have been Progress in Lipid Research and Annual Reviews in Nutrition, with impact factors of 11.19 and 8.69, respectively, for 2007. Table 1 lists the impact factors for the BJN and nine comparator journals over the period 2001 to 2007 inclusive. The comparator journals all publish a similar range of material as does the BJN, including molecular, cellular, whole body, human, clinical, public health and experimental animal nutrition and, in most cases, also farm animal nutrition. It is evident that the American Journal of Clinical Nutrition is firmly established as the highest ranked journal in this category that is not solely limited to publishing review articles. Unfortunately, in 2007, the impact factor of the BJN slipped from 2.71 to 2.34 (1441 citations in 2007 to the 616 articles published in 2005 and 2006) and it fell below its historic ranking within the top ten nutrition and dietetics journals. I have calculated that if each paper published in the BJN in 2005 and 2006 was cited just once more than it actually was, the impact factor would have been 3.34! Readers may be interested in the impact factors of our sister journals for 2007 these were 3.93, 1.89 and 1.86 for Proceedings of the Nutrition Society (ranked 6/56), Nutrition Research Reviews (26/56) and Public Health Nutrition (27/56), respectively.

Table 2 (4–12) lists the articles published in the BJN during 2005 and 2006 that were most cited in 2007. This Table indicates the importance of review articles and the Progress in Nutritional Science series to the impact factor of the journal. Although the articles published in 2005 continue to be cited (Table 2), they will not contribute to the impact factor for 2008 which will be based upon articles published in 2006 and 2007. This Table hints at the reason for the slip in impact factor for 2007. The top nine cited papers from 2005 and 2006 were cited between 11 and 21 times (average 14). In contrast, the top nine papers from 2004 and 2005 were cited between 13 and 79 times in 2006 (average 25) (53).

One argument against the importance of impact factor in indicating the ‘value’ of a journal is that the time frame over which it is calculated is too short to really reflect the impact that the articles that a journal publishes will have. Thus, alternative measures of article citations are available. These include the total number of citations made to articles published in a journal, and the cited half-life of articles. Table 3 lists the total number of citations made to articles published in the BJN, irrespective of their year of publication, during the years 2000 to 2007. In 2007 articles published in the BJN were cited 9843 times, placing the BJN fifth in the Nutrition and Dietetics category for total citations in 2007. It is apparent that the total number of citations of articles in the journal has increased year-on-year and has increased by almost 85% since 2000. The cited half-life of a journal (Table 3) is the median age of the articles published in that journal that are cited in the reporting year. Thus, publication of articles that remain important (or controversial) long after they are published will result in a long cited half-life. For 2007 Nature, Cell and Science have cited half-lives of 8.0, 8.7 and 8.0 years, respectively. Thus, these journals are publishing articles that are seen as important in the short term, as judged by the high impact factor, but which remain important for many years after publication, as judged by the cited half-life. There may, of course, be other influences on cited half-life. For example, publication of articles of little interest by a journal that in the past has published articles that still remain of interest will result in a long cited half-life.
The cited half-life of the BJN for 2007 was 7.1 years, indicating that half of the citations to articles in BJN in 2007 were to articles published in 2000 or before. Thus, it seems to me that the BJN is publishing articles that are seen as important in the short term, as judged by the reasonably high impact factor (within the journal category), but which remain important for many years, as judged by the cited half-life. For comparison, the cited half-lives for the American Journal of Clinical Nutrition and the Journal of Nutrition for 2007 were 7.7 and 6.5 years, respectively.

The final statistic that is shown in Table 3 is the immediacy index. This is calculated as citations of articles published in the reporting year (for example, 2007) divided by papers published in that same year. It is a measure of how immediately important (or controversial) published papers are. For 2007, the immediacy index of the BJN was 0.337. For comparison, the immediacy indexes for the American Journal of Clinical Nutrition and the Journal of Nutrition for 2007 were 0.584 and 0.610, respectively.

As I indicated in my previous editorials, the BJN is receiving more submissions and is publishing more articles than ever before. This suggests that the journal is in very good health and is viewed favourably by researchers within the discipline. The communications that I receive indicate that authors want to publish their work in the BJN. My aim is to act to improve the impact factor in order that the prestige and attractiveness of the BJN are maintained, in the face of mounting competition from other journals, and that its perceived quality is enhanced. This will require a more stringent set of criteria for acceptance of papers and will undoubtedly be unpopular with some authors. However, an improvement in (perceived) quality of the BJN will assure its place amongst the top journals in the field and as Editor-in-Chief it is my role to strive for this.
