Order From Chaos

By Donatella Marazziti, MD

Psychiatry research and practice are undergoing a process of profound change sustained by neuroscientific data. On one hand, this has permitted great advancements in the fields of diagnosis, pathophysiology, and treatments of mental disorders. On the other hand, it has raised new doubts and problems. Nosological categories are subject to continuous definitions and refinements, the cut-off points and limits of each entity move from one part to another. New concepts such as comorbidity or spectrum disorders are introduced to accommodate clinical observations and findings; therefore, diagnostic criteria have become more reliable, but still are not universally applied and not paralleled by adequate instruments for assessment.

Similarly, the emergence of biological theories in psychiatry, triggered in the beginning by psychotropic drug discovery, are now more autonomous and based upon neuroscientific paradigms. They are further strengthened by our increased knowledge of the pathophysiology of mental disorders. However, no real causality model or mechanism has been identified and we continue to describe biological correlates of mental disorders, without touching their secret nature. Therefore, it seems reasonable to devote another issue of CNS Spectrums to open questions encountered in psychiatric practice, such as those related to obsessive-compulsive disorder or mixed states, and to methodologies that might be helpful to psychiatrists, although current applications of such methodologies are not yet clearly visible.

In fact, psychiatry has reached a critical point: We know where we left off and the subsequent steps, but the current accumulation of data are growing at such a pace that it is sometimes difficult to follow even single topics—to orientate oneself in the “jungle” of inputs and findings. This process appears in some way senseless or too chaotic to be approached by traditional methods. Certainly, this peculiar situation should force us to be more creative than in the past, to reshape our minds, to try “new ways of thinking about the brain,” as Crick stated nearly 20 years ago. This attitude is urgent and necessary if we want to proceed and to cope with the terrific growth of neuroscience and its impacts on psychiatry.

If revised, even traditional approaches, such as those provided by neuroendocrinology, may constitute instruments that shed a new light on brain mechanisms. Computer applications in psychiatry, as is easily predicted, will become broader in the next years. We should be aware, however, that they are only aid instruments and certainly not objectives. Also, we must have a certain degree of courage, and maybe even madness, to initiate new pathways.

With bold extrapolations, Einstein shaped a new vision of the cosmos and of natural phenomena that gave rise to the profound changes in modern physics whose development could not be predicted and whose future achievements cannot be easily envisioned. In order to give an idea of the methods used in modern physics, this issue of CNS Spectrums contains a paper on the problems connected with the study of complex systems such as the brain (“Complexity in Science” by Dr. Arecchi), a paper that might appear difficult to nonspecialists, but I believe it merits a careful reading because of the suggestions it provides.

It is really interesting that chaotic phenomena may be subjected to mathematical analyses and described in terms of equations. It is even more intriguing that increased chaos does not always destroy order, but creates a new type of order that is able to transform the multitude of the constitutive elements in a coherent whole. Therefore, order and chaos cannot be considered total opposites. And what is more suitable than this model to explain the complexity of the brain and mental disorders? According to these concepts, the difference between physiological and pathological phenomena is not net, since a disease may be considered as a consequence of physiological variability. “Order from disorder sprung,” the great writer Milton wrote, and I fervently believe that the human brain has the possibility and the skills to find the principles governing its apparent chaos.

CNS Spectrums
The International Journal of Neuropsychiatric Medicine

INTRODUCTION
CNS Spectrums is a peer-reviewed journal that publishes original scientific literature and reviews on a wide variety of neuroscience topics of interest to the clinician. CNS Spectrums will publish 10 issues in 1998. As the immense prevalence of comorbid diseases among patients seen by psychiatrists and neurologists increases, these physicians will jointly diagnose and treat the neuropsychiatrically ill. Our mission is to provide these physicians with an editorial package that will enhance and increase their understanding of neuropsychiatry. To this end, manuscripts that address crossover issues germane to neurology and psychiatry will be given immediate priority.

SCOPE OF MANUSCRIPTS
CNS Spectrums will consider the following types of articles for publication:

Original reports: Original reports present methodologically sound original data.

Reviews: Reviews are overview articles that summarize and synthesize the literature on various topics in a scholarly and clinically relevant fashion. Suitable topics include mood disorders, schizophrenia and related disorders, personality disorders, substance-use disorders, anxiety disorders, neuroscience, psychosocial aspects of psychiatry, child psychiatry, geriatric psychiatry, and other topics of interest to clinicians. nb: Original flowcharts designed to aid the clinician in diagnosis and treatment will be considered for publication in reviews and are encouraged.

Case reports: Single or multiple case reports will be considered for publication.

Letters to the editor: Letters will be considered for publication.

MANUSCRIPT PREPARATION
General information: Two copies of the manuscript should be submitted to Eric Hollander, editor (or in Europe to Joseph Zohar, international editor), c/o MBL Communications, Inc., 665 Broadway, New York, NY 10012; (T) 212-328-0800, (F) 212-328-0600. Authors are required to submit their manuscripts on computer disks. If possible, please provide them in MSWord, WordPerfect, or Word for Windows in either a Macintosh or IBM format (saving the file in a lower version, eg, MSWord 3.0, is also encouraged). Disks should be labeled with the word-processing program, title of paper, and first author's name.

Letters of permission to reproduce previously published material: All material reproduced from previously published copyrighted material must be accompanied by a letter of permission from the copyright holder. All such material should include a full credit line (eg, in the figure or table legend) acknowledging the original source. Any citation of unpublished material or personal communication should also be accompanied by a letter of permission for anyone who is not an author of the paper.

Peer review: Physician-authored manuscripts will be reviewed by members of CNS Spectrums' editorial advisory board as well as selected outside reviewers. The corresponding author will be notified by the editors when a decision regarding acceptance has been made. Accepted manuscripts and letters will be edited for clarity and style.

DISCLOSURE OF COMMERCIAL INTERESTS
The authors must include a statement about all forms of support, including grant and drug company support. Such information may, at the editor's discretion, be shared with reviewers. If the article is accepted for publication, the editors will consult with the authors as to whether this information should be included in the published paper.

Reprints: Materials are accepted for exclusive publication in CNS Spectrums and become the property of CNS Spectrums. To request permission to reprint materials published by CNS Spectrums, please fax the Managing Editor, c/o MBL Communications, 665 Broadway, New York, NY 10012; (F) 212-328-0600. Please include statement of purpose, number of copies, and date to be reprinted.

Continuing Medical Education requirements: Authors must submit two multiple-choice questions with answers. Three objectives that indicate the instructional content and/or expected learning outcomes must be attached upon submission.

SUBMISSION CHECKLIST
1. Original manuscript plus copy
2. Copies of permission letters to reproduce previously published and unpublished material
3. Two multiple-choice questions with answers and three teaching objectives
4. Disk labeled with the word-processing program, title of paper, and first author's name
