the process of globalisation seen in particular over the past
decade. In addressing this situation we have to accept the
fact that governments and societies in the industrialised
world do not have the social interest to address and resolve
this problem (Sox, 2002), while governments and socie-
ties in many other regions of the world do not have as yet
the financial strength to address and resolve this situation
either. Thus, it is imperative that national associations and
societies in psychiatry from both high-income nations and
low- and middle-income countries prioritise this issue. These
associations and societies need to work together to develop
a strategic plan of action to address this mental health
problem. The World Psychiatric Association (WPA) has never
addressed this situation in a worldwide effort. The World
Health Organization (WHO) has made reference to it but has
not yet made it a priority. Therefore, we need psychiatry’s
leaders to bring this situation to the forefront of the profes-
sion. This issue is currently the greatest challenge to the
mental health system worldwide. To continue to look the
other way is both inhumane and unacceptable.

Teaching and training in psychiatry

David Skuse

One of the chief remits of the Board of International
Affairs of the Royal College of Psychiatrists is to high-
ligh, review, encourage and determine the development of
psychiatric training, and to support trainees through
collaboration in the development of curricula, as well as
in relation to the conduct of examinations and continuing
professional development. Here we present three more or
less polemical articles that report on difficulties pertaining
to the training of psychiatrists in Bangladesh, India and
Europe. In each case, the authors turn to the College for
advice and, potentially, intervention, with the aim of standardising the training of psychiatrists around
the world.

Mohammad Mullick works in Bangabandhu Sheikh Mujib
Medical University, in Dhaka, Bangladesh. Dhaka is situated
on the banks of the Buriganga River and has a population of
some 11 million. It is the largest city in Bangladesh and
one of the fastest-growing cities in the world. In a country
of over 120 million there are only 77 trained psychiatrists, and
just two child psychiatrists for 47 million children under 15
years of age. While it would seem the quality of training is
good, he asks how, given the limited resources available for
aspirant psychiatrists, it is going to be possible to provide
the numbers of mental health specialists required to deal with
a vast and largely hidden need. He makes a number of sugges-
tions about how the College could help, principally with a
variety of schemes aimed at training the second generation
of potential Bangladeshi psychiatrists. He does not discuss
the substantial ’brain drain’ of mental health workers from
that country, a topic that has recently been reviewed by

Professors Kulhara and Avasthi from Chandigarh,
India, discuss the similar problems facing that country in
its attempts to train a new generation of psychiatrists.
One point they forcefully make concerns the extraordinary
discrepancies between different regions of India in their pro-
vision of medical schools. The range is from just one small
school in, for example, Chandigarh (with a population of 90
million) to 32 schools in Karnataka (population 56 million).
Persuading medical students to consider a career in psy-
chiatry is not easy at the best of times, and the relative lack
of exposure to the specialty in curricula laid down by the
Medical Council of India, together with lack of examinations
in the subject, does not encourage many to select it. They
review a range of problems, before turning to the College
with a number of specific suggestions about how it might
be able to help.

No doubt both the South Asian and European Interna-
tional Divisions of the College could have a role in responding to
these pleas from the Indian subcontinent and to the third
of our contributions, which concerns the state of psychiatric
training in Europe. James Strachan draws our attention to
an anomaly whereby the European Union requires mutual
recognition of postgraduate specialist training schemes, but
the content of those schemes is by no means subject to the scrutiny one might expect. He raises some interesting issues that deserve exploration in a future issue of *International Psychiatry*, for example the pressure being brought to bear by insurance companies upon medically trained psychotherapists, who deliver expensive treatment in comparison with non-medical professionals. This has parallels with the ‘hospital medical officer’ saga in the United States over the past decade and raises the spectre of what some have called the practice of ‘bottom line’ medicine.

**Teaching and training in psychiatry and the need for a new generation of psychiatrists in Bangladesh: role of the Royal College of Psychiatrists**

Mohammad S. I. Mullick

Professor of Child and Adolescent Psychiatry, Department of Psychiatry, Bangabandhu Sheikh Mujib Medical University, Dhaka, Bangladesh, email mullick@bdonline.com

**Bangladesh**

*Bangladesh is a small, populous South Asian nation with poor literacy, limited resources and a lack of basic healthcare. Caring for people with psychiatric disorders in such a setting is challenging. The prevalence of psychiatric disorder in Bangladesh is similar to that in other countries, yet there is a severe shortage of well trained psychiatrists and a lack of even basic mental health services. To generate large numbers of well trained psychiatrists, Bangladesh must expand its high-quality psychiatric training and education at both the postgraduate and the undergraduate levels. To achieve these ambitious goals, Bangladesh needs help and assistance from regional and international institutions. The Royal College of Psychiatrists can play a role of critical psychiatric public health importance by helping Bangladesh locally train a new generation of psychiatrists who will care for the vast number of those with ailments of mind and soul.*

**Bangladesh: basic facts**

Bangladesh is densely populated, having a total area of 147,570 km² and a population of 123.85 million. About 45% of that population are under 18 years of age and 72% live in rural areas. Islam is the major religion (practised by around 88% of the population), followed by Hinduism (11%). Most Bangladeshis share a common language and sociocultural heritage. The economy, which in large part depends on agriculture, is perennially affected by flood (Asiatic Society of Bangladesh, 2003). The average per capita income is US$4,444 and the economic growth rate is around 6% per annum (Bangladesh Bureau of Statistics, 2004).

**Extent of mental health problems in Bangladesh**

The prevalence of mental health problems in Bangladesh has been variously estimated to be between 7% and 16% (Chowdhury *et al.*, 1981; Mullick & Goodman, 2005). It is estimated that over 11 million adults and 8 million children and adolescents are in need of mental health services. Yet these people face both a lack of adequately trained mental health professionals and the absence of a structured mental health service.

**Evolution of teaching and training in psychiatry**

After Bangladesh achieved independence from Pakistan in 1971, undergraduate psychiatry training was established, with new departments of psychiatry. In 1979 a postgraduate course was started at the Bangladesh College of Physicians and Surgeons (BCPS). A course offering a Diploma in Psychological Medicine (DPM) began in 1975 at the former Institute of Postgraduate Medicine and Research (IPGM&R, now the Bangabandhu Sheikh Mujib Medical University, BSMMU). This course was replaced by an MPhil course in 1995. In 2001, an MD course in psychiatry started at the BSMMU.
