Identifying and evaluating arguments: logic and morality

Questions to stimulate reflection

Deduction delivers certainty, induction doesn't. Does this make deduction better than induction?

Why doesn't induction deliver certainty?

What is the definition of validity? Why is validity useful if valid arguments can have false conclusions?

What is a 'counterexample'? How does a counterexample demonstrate the invalidity of an argument?

Can you name three different types of inductive argument?

What are the five steps to take in setting out an argument logic-book style?
