

Plant Parts

Plants have many **parts**.

The Earth and the Sun

Day and night.

Light from the Sun comes to the Earth. Some of the Earth is in the light but some of the Earth is in the dark.

The Earth **spins** so all parts of the Earth have time in the light and time in the dark. We call these times **day** and **night**.

Food Groups

Foods can be put into **groups**.

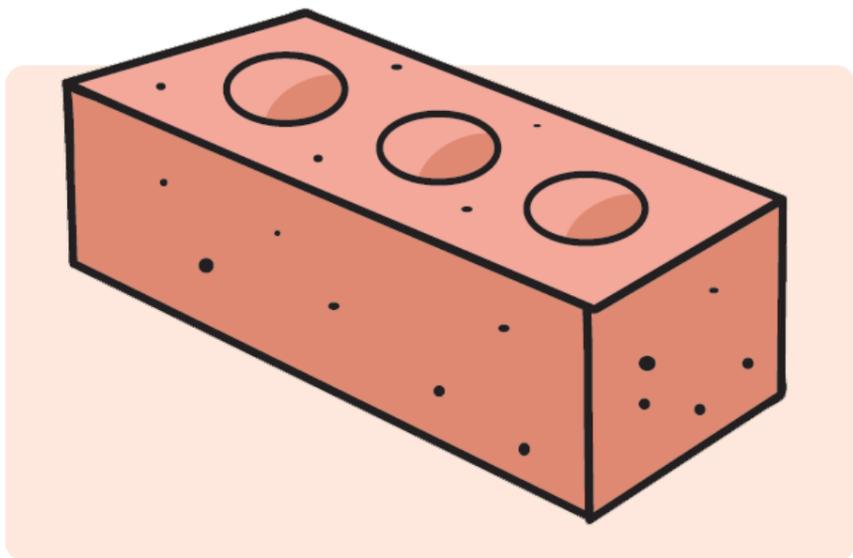

Solids, Liquids and Gases

Matter exists in three different states.
A state of matter is called a phase. These phases are known as **solid**, **liquid** or **gas**.

Water is a liquid.

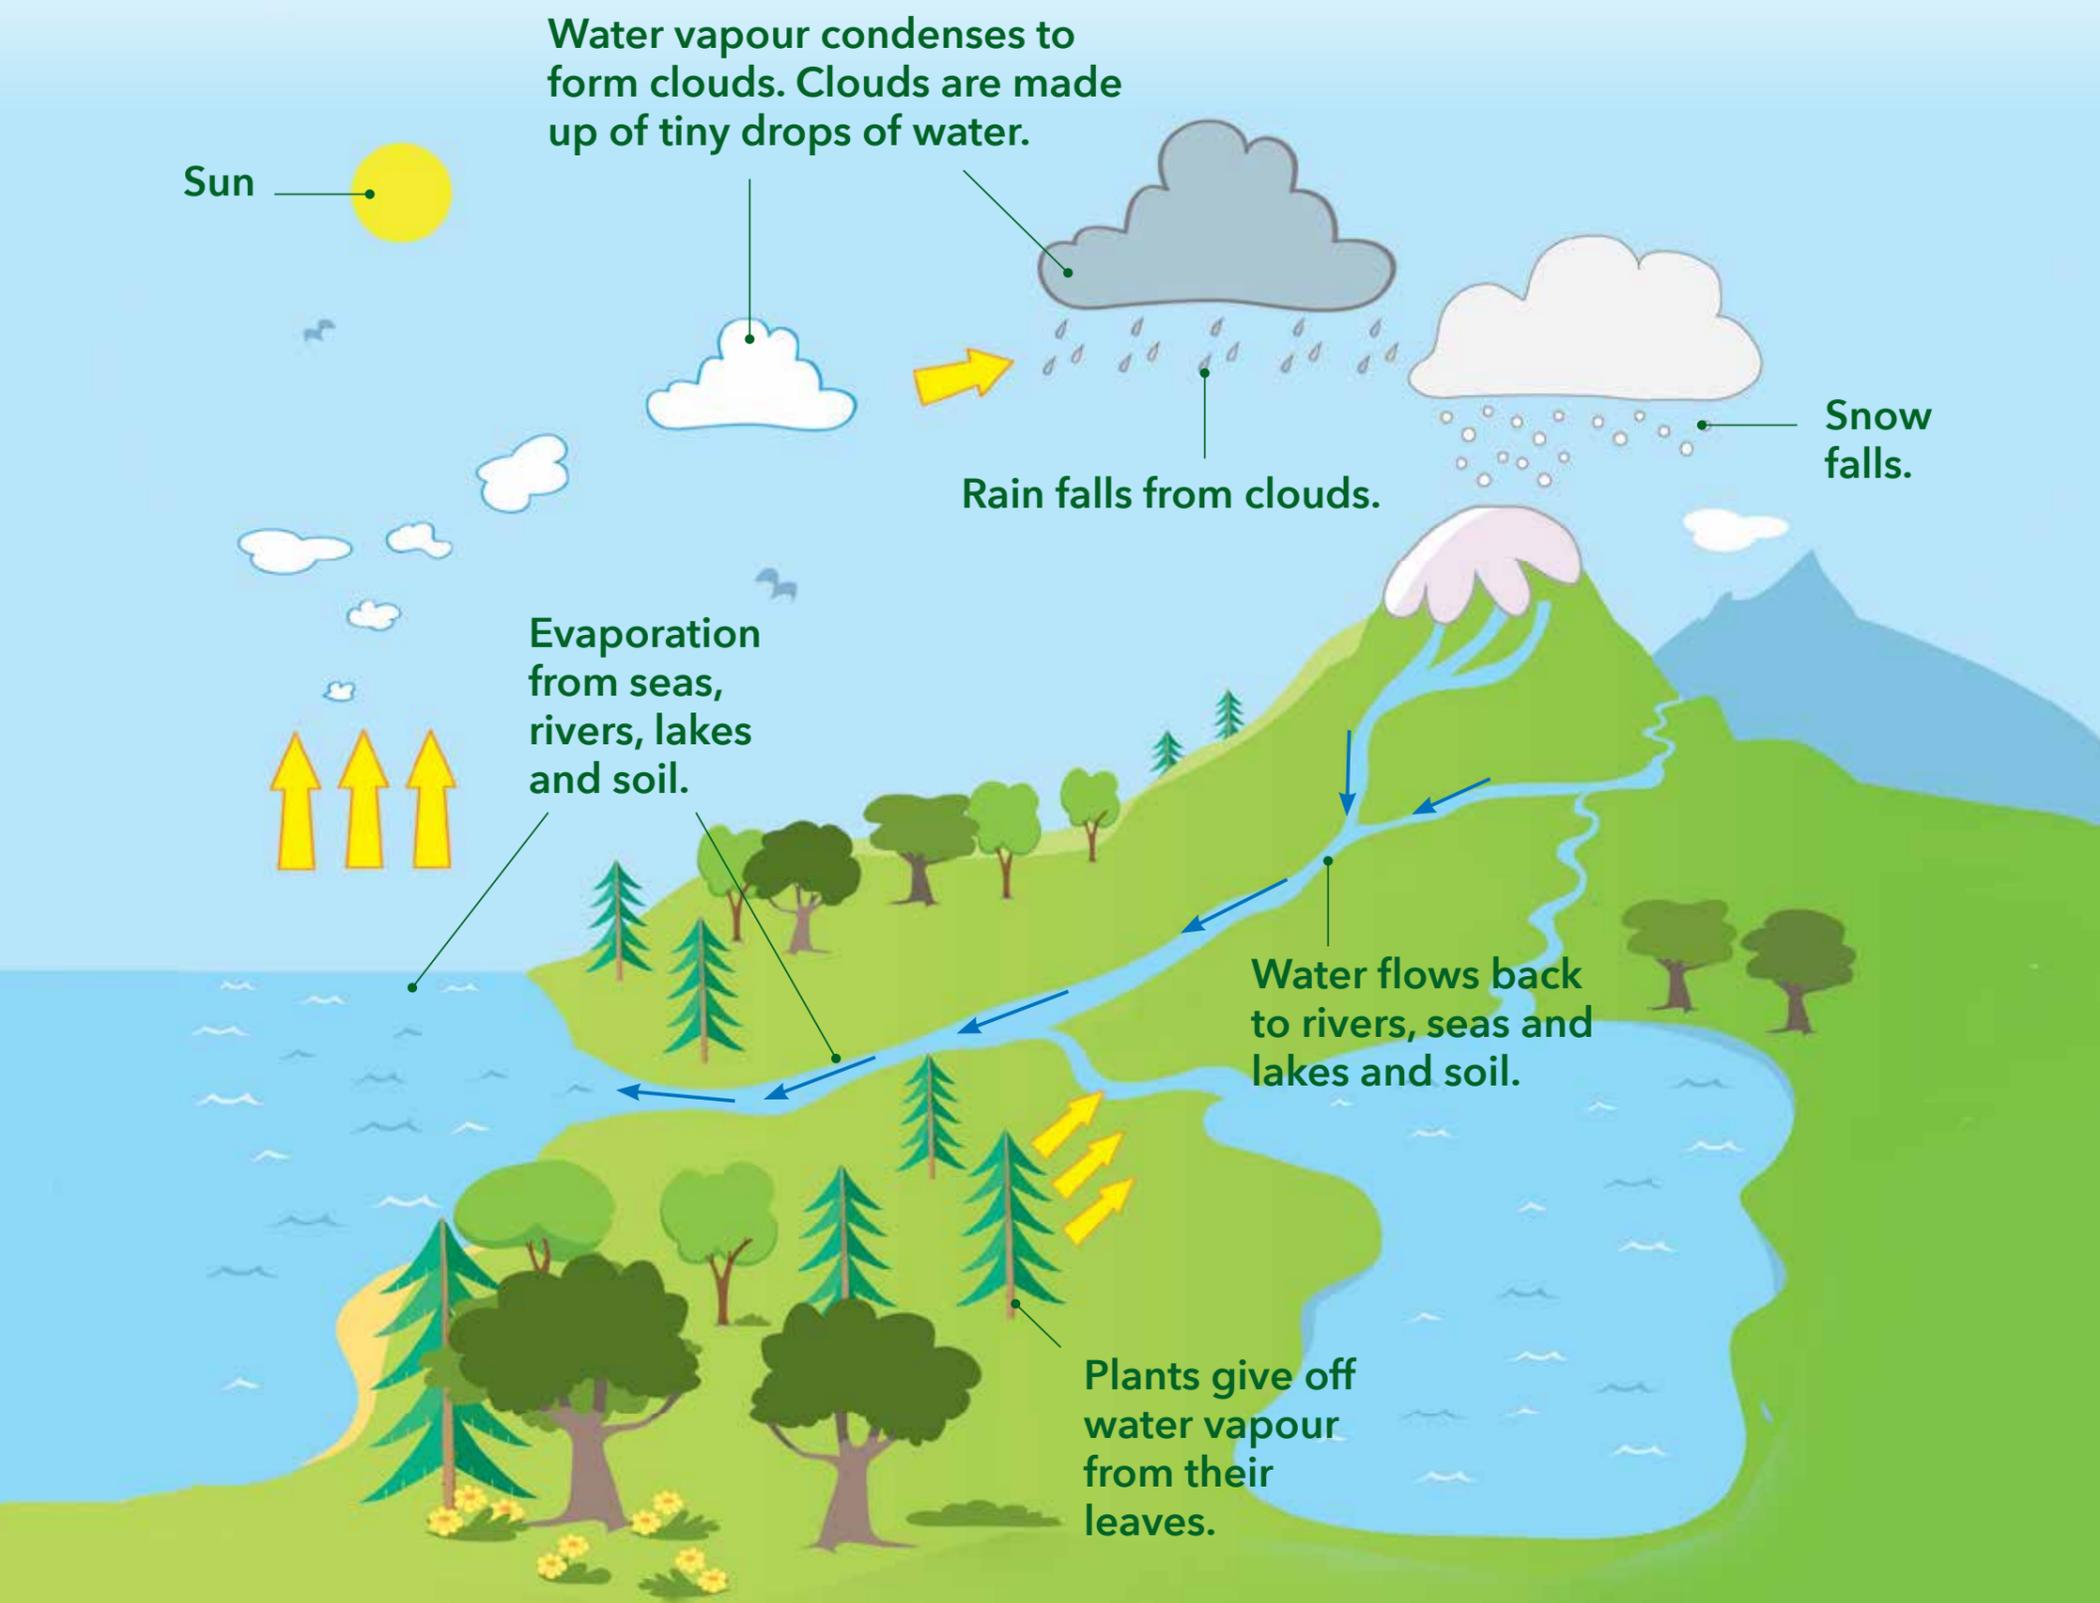

A brick is a solid.

The air inside the bubble is a gas.

The Water Cycle

Water keeps going around and around in what we call the **water cycle**. In the water cycle, water moves from the land and sea to the air and back again.

The water cycle happens mainly because of evaporation and condensation. Freezing and melting also happen in the water cycle.

Body Organs

Different organs work together to form **organ systems**.
