THE THERAPEUTIC INTERVIEW IN MENTAL HEALTH

A Values-Based and Person-Centered Approach

Giovanni Stanghellini
University of Chieti-Pescara, Chieti, Italy

and Milena Mancini
University of Chieti-Pescara, Chieti, Italy

Emotions and values are considered the keys to understanding peoples’ experiences and actions within the world they inhabit. The traditional symptom-led clinical interview is frequently criticised for ignoring the narrative of a patient’s experience in favour of ticking-off symptoms that can be reduced or controlled. In response, this important new book seeks to understand a patient’s sufferings through their individual experiences and values. The Therapeutic Interview in Mental Health is about the art of asking questions. This comprehensive book will equip psychologists, psychiatrists and clinicians with the tools to begin unlocking the emotions and experiences of their patients. The method of the therapeutic interview is explained in a step-by-step way, allowing the reader to understand the clinical interview as a means of beginning a shared understanding between patient and clinician. This book is an essential read for all psychologists, psychiatrists, general clinicians, and medical trainees.

Delusions, in their many different manifestations, are central to the concepts of madness and psychosis. Yet what causes them remains in many ways a complete mystery. McKenna’s Delusions is the first comprehensive attempt to tackle one of the most arresting phenomena in psychiatry: an in-depth and critical review of what delusions are, the forms they can take and how they might be explained from both psychological and biological perspectives. Delusions covers key topics such as the clinical features of delusions, the disorders they are seen in, other oddities that resemble them in both health and disease, and the different approaches that have been taken to try to understand them. It is an essential book for psychiatrists and psychologists who work with delusional patients, as well as being of interest to neuroscientists engaged in research into major psychiatric disorders.

Patients with nonepileptic seizures (NES) frequently present in neurology, psychiatry, psychology, and emergency departments. The disorder has been well-documented in the medical literature, and much is known about the phenomenology, ictal semiology, neurologic signs, psychiatric comorbidities, neuropsychological testing, and psychosocial aspects. Since the publication of the third edition in 2010, knowledge of treatments for NES has grown and new data have become available. Fully updated to reflect these developments, this fourth edition brings together the current knowledge of NES treatments, drawing on the experience of an international team of authors. An accompanying website features video-EEGs of seizures and videos of patient-physician interactions, which will help readers with both diagnostic and management decisions. Tables clearly illustrating the differential diagnosis of various nonepileptic events give readers quick reference guides to aid diagnostic assessment. A valuable resource for neurologists, psychiatrists, psychologists, and any clinicians who encounter NES in their practice.

THE PSYCHOSES OF MENSTRUATION AND CHILDBEARING

Ian Brockington
University of Birmingham

Foreword by Mario Maj

Childbearing, from the standpoint of psychological medicine, is the most complex event in human experience. Of the dozens of disorders that affect the generative process, or are unleashed as complications, many fall under the heading of ‘psychoses’ – profound disturbances of thought, perception, cognition and behaviour. These psychoses disrupt personal and family life at a critical time. Reviewing the wide range of psychoses that complicate the reproductive process, Ian Brockington proposes radical changes to the concepts of postpartum and menstrual psychoses, with suggestions for fresh research initiatives. Armed with this comprehensive knowledge and wielding a raft of interventions, many women can be restored to health and their vital roles in the family and community. When the risk factors are known, multidisciplinary preventive strategies can transform the lives of vulnerable women. This is essential reading for psychiatrists, obstetricians and gynaecologists, midwives, general practitioners, neuroscientists and related professions worldwide.

CONTENTS

WHY IT WILL SELL

- Provides a complete account of childbearing and menstrual psychoses, based on over 3000 works in many languages
- Describes the complexity of the psychoses of childbearing, including many organic and non-organic forms, to aid a better diagnosis and treatment
- Presents over twenty distinct forms of psychoses, offering insights for further research

SMELL AND TASTE DISORDERS

Christopher H. Hawkes

and Richard L. Doty
University of Pennsylvania

Loss of the sense of smell or taste is often a sign of neurological disease. Evaluating chemosensation (the senses of smell and taste) during neurological examination can help early detection of neurodegenerative conditions such as Parkinson’s and Alzheimer’s disease. The importance of such testing is now receiving increasingly high profile in the medical curriculum. In this book, olfactory conditions are completely updated and the sense of taste is now included in similar detail. It is written by experts in the field, covering anatomy and physiology of human olfaction and taste, how they can be measured and their relevance to a wide range of major disorders such as diabetes, kidney disease, Alzheimer’s and Parkinson’s disease. The ‘Olfactory Vector Hypothesis’ that suggests a neuropathogen may enter the nose en route to the brain is evaluated in detail. This introduction to smell and taste disorders is an essential guide for neurologists, neurosurgeons, otolaryngologists, medical trainees, and chemosensory scientists.

Third edition
Royal College of Obstetricians and Gynaecologists

This handbook is designed to introduce trainee obstetricians and gynaecologists to safe surgical techniques and obstetric skills in a structured workshop environment. It is the course manual for the Basic Practical Skills in Obstetrics and Gynaecology course offered by the Royal College of Obstetricians and Gynaecologists, successful completion of which is mandatory to obtain an ST3 post. The manual consists of modules covering basic open general surgical techniques (such as instrument handling, suturing and knot tying); basic obstetric skills (such as pelvic anatomy, instrumental delivery and shoulder dystocia); and basic gynaecological procedures, including hysteroscopy and laparoscopy. This revised and fully updated edition is in line with the latest course, and includes new sections on human factors and basic ultrasound. The course and the manual provide a valuable early step towards building safe and sound surgical and obstetric skills, giving trainees a firm foundation for their future careers in obstetrics and gynaecology.

Biopsychosocial factors are integral to all aspects of healthcare but perhaps nowhere more so than in obstetrics, gynaecology and women’s health. This is probably because so much of what occurs in the specialty involves dramatic, life-changing events – from pregnancy and childbirth to menopause and malignancy. This text was planned to inform clinical care and improve the psychological element of women’s healthcare. The content covers a wide spectrum of care, including chapters on all the major subspecialties. The two editors, between them, have long-term and broad experience of writing and researching the areas covered in this text. Obstetricians, gynaecologists, midwives, psychiatrists, psychologists and those in many other areas of healthcare, including healthcare managers, should read this book. It is hoped that a distillate of its content will be incorporated in general and subspecialty training curricula to optimise the future care given to patients, partners and offspring.
